## *The NASA STI Program Office ... in Profile*

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

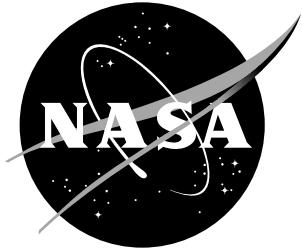

- TECHNICAL PUBLICATION. Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counter-part of peer reviewed formal professional papers, but having less stringent limitations on manuscript length and extent of graphic presentations.
- TECHNICAL MEMORANDUM. Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- CONTRACTOR REPORT. Scientific and technical findings by NASA-sponsored contractors and grantees.
- CONFERENCE PUBLICATION. Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- SPECIAL PUBLICATION. Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- TECHNICAL TRANSLATION. English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that help round out the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results ... even providing videos.

For more information about the NASA STI Program Office, you can:

- Access the NASA STI Program Home Page at <http://www.sti.nasa.gov/STI-homepage.html>
- E-mail your question via the Internet to [help@sti.nasa.gov](mailto:help@sti.nasa.gov)
- Fax your question to the NASA Access Help Desk at (301) 621-0134
- Phone the NASA Access Help Desk at (301) 621-0390

## Abstract

*This report presents three methods of implementing the Dryden power spectral density model for atmospheric turbulence. Included are the equations which define the three methods and computer source code written in Advanced Continuous Simulation Language to implement the equations. Time-history plots and sample statistics of simulated turbulence results from executing the code in a test program are also presented. Power spectral densities were computed for sample sequences of turbulence and are plotted for comparison with the Dryden spectra. The three model implementations were installed in a nonlinear six-degree-of-freedom simulation of the High Alpha Research Vehicle airplane. Aircraft simulation responses to turbulence generated with the three implementations are presented as plots.*

## Introduction

An important part of an aircraft simulation is the capability to simulate atmospheric turbulence. Such a capability is useful in evaluating flight control system performance and assessing control effector activity. The Dryden turbulence model of power spectral density as specified in MIL\_STD\_1797A (ref. 1) is frequently used as the basis for turbulence simulation. The turbulence model is also discussed in reference 2. This report presents source code for three different approaches to implementing the model in a six-degree-of-freedom aircraft simulation and presents results obtained with these implementations.

## Symbols

Variable:

|                  |  |
|------------------|--|
| $a$              | Intermediate variable defined by equation (44); used in equation (43)  |
| $a_i, a_j$       | Intermediate variable for the i-th or the j-th component of turbulence ; used in equations (52) and (53) as defined by equations (54); used in equations (56) as defined by equations (57) |
| $b$              | Intermediate variable defined by equation (44)   |
| $b_w$            | Reference wing span  |
| $C_{BL}$         | Mapping constant used in the Tustin transform to relate frequencies in the digital filter response to frequencies in the analog response for the u-, v-, and w-components                  |
| $C_{BLi}$        | Mapping constant used in the Tustin transform to relate frequencies in the digital filter response to frequencies in the analog response for the i-th component, $i=p,q,r$                 |
| $c$              | Intermediate variable defined by equation (44)   |
| $d$              | Intermediate variable defined by equation (44)   |
| $e$              | Intermediate variable defined by equation (44)   |
| $f$              | Intermediate variable defined by equation (44)   |
| $G_{di}(\omega)$ | Power spectral density of the i-th component of turbulence, discrete model   |
| $H_i(z)$         | Transfer function used to compute the i-th component of turbulence in the $z$ - or the $s$ -domain   |
| $H_i(s)$         |  |

|                                |  |
|--------------------------------|--|
| $\tilde{H}_i(e^{j\omega T_v})$ | Transfer function used to compute the frequency response of $H_i(z = e^{j\omega T_v})$   |
| $K_i$                          | Intermediate variable defined by equation (44)   |
| $k_i, k_j$                     | Coefficient in difference equation in the MIL STD model for calculating the i-th or the j-th component of turbulence ; defined by equation (57)      |
| $L_i$                          | Scale length of i-th component of turbulence   |
| $M_{r+}, M_{r-}$               | Intermediate variables defined by equation (51)  |
| $\hat{M}_g$                    | Intermediate variable defined by equation (60)   |
| $\hat{m}_{\xi_i}^{(j)}$        | Sample mean of the j-th sample sequence of the i-th component of turbulence  |
| $m_g$                          | Mean, or expected value, of $g$  |
| $N$                            | Number of samples in turbulence sequence   |
| $R_{i-}$                       | Intermediate variable defined by equation (74)   |
| $R_{j-}$                       | Intermediate variable defined by equation (72)   |
| $R_{i+}$                       | Intermediate variable defined by equation (77)   |
| $R_{j+}$                       | Intermediate variable defined by equation (75)   |
| $R_{j-\tau}$                   | Intermediate variable defined by equation (73)   |
| $R_{j+\tau}$                   | Intermediate variable defined by equation (76)   |
| $R_{ii}(\tau)$                 | Autocorrelation function of the i-th component of turbulence   |
| $s$                            | Laplace transform variable   |
| $S_i(\omega)$                  | Two-sided power spectral density of i-component of turbulence, continuous model  |
| $T$                            | Length of turbulence sequence ( $T = NT_v$ )   |
| $T_v$                          | Sample interval in digital simulation of turbulence  |
| $V$                            | Total airspeed   |
| $X$                            | Intermediate variable defined by equation (57)   |
| $x_i$                          | Intermediate variable used in computation of i-th component of turbulence  |
| $Y$                            | Intermediate variable defined by equation (57)   |
| $z$                            | z-transform variable   |
| $v_i, v_i(k)$                  | Random white noise sequence used as inputs to the differential equations or difference equations for computation of the i-th component of turbulence |
| $v_j(z)$                       | z-transform of $v_i(k)$  |
| $\xi_i, \xi_i(k)$              | Random sequence representing the i-th component of turbulence  |
| $\xi_i(z)$                     | z-transform of $\xi_i(k)$  |
| $\pi$                          | Pi ( $= \text{arc cos}(-1)$ )  |
| $\Phi_i(\omega)$               | Single-sided power spectral density of i-th component of turbulence, continuous model  |

|                              |   |
|------------------------------|---|
| $\tau_i$                     | Time constant of the i-th component of turbulence   |
| $\sigma_i$                   | Desired root-mean-square value of the i-th component of turbulence  |
| $\hat{\sigma}_{\xi_i}^{(j)}$ | Sample standard deviation of the j-th sample sequence of the i-th component of turbulence                               |
| $\hat{\Sigma}_g$             | Standard deviation of $g$   |
| $\Sigma(\hat{\sigma}_i)$     | Standard deviation of the sample standard deviation of $i$ ( $= \sqrt{E\{(\hat{\sigma}_i - E\{\hat{\sigma}_i\})^2\}}$ ) |
| $\Sigma(\hat{m}_i)$          | Standard deviation of the sample mean of $i$ ( $= \sqrt{E\{(\hat{m}_i - E\{\hat{m}_i\})^2\}}$ )                         |
| $\omega$                     | Angular frequency   |
| $\omega_w$                   | Reciprocal of time constant for the w-component of turbulence ( $= 1/\tau_w$ )  |
| $\omega_i$                   | Intermediate variable defined by equation (44) and equation (53)  |

Subscripts:

|     |  |
|-----|--|
| $i$ | Denotes turbulence component (u, v, w, p, q, or r)                           |
| $j$ | Denotes turbulence component (u, v, w, p, q, or r)                           |
| $u$ | Denotes linear velocity or turbulence component along x-axis (body axis)     |
| $v$ | Denotes linear velocity or turbulence component along y-axis (body axis)     |
| $w$ | Denotes linear velocity or turbulence component along z-axis (body axis)     |
| $p$ | Denotes rotational velocity or turbulence component about x-axis (body axis) |
| $q$ | Denotes rotational velocity or turbulence component about y-axis (body axis) |
| $r$ | Denotes rotational velocity or turbulence component about z-axis (body axis) |

Superscripts:

|         |                              |
|---------|------------------------------|
| ( $j$ ) | Denotes j-th sample sequence |
|---------|------------------------------|

Operators and Notation:

|                        |  |
|------------------------|--|
| $E\{\cdot\}$           | Denotes expected value of argument                   |
| $F^{-1}\{\cdot\}$      | Denotes inverse Fourier transform of argument        |
| $\sum_{k=1}^N [\cdot]$ | Denotes summation of argument over $k$ from 1 to $N$ |
| $ \cdot $              | Denotes absolute value of argument                   |

Abbreviations:

|         |   |
|---------|---|
| ACSL    | Advanced Continuous Simulation Language |
| HARV    | High Alpha Research Vehicle             |
| MIL STD | Military Standard                       |

|     |                        |
|-----|------------------------|
| PSD | power spectral density |
| rms | root-mean-square       |

## ACSL Test Program (GUSTMDL)

A test program named GUSTMDL was developed to evaluate implementations of the three models prior to installation in the aircraft simulation. GUSTMDL contains algorithms to simulate linear ( $u$ ,  $v$ ,  $w$ ) and rotational ( $p$ ,  $q$ ,  $r$ ) velocity components of turbulence using the three models: continuous, Tustin transform, and Military Standard (MIL STD) algorithms. The GUSTMDL program was written using the Advanced Continuous Simulation Language (ACSL) to be easily implemented into the F18 High Alpha Research Vehicle (HARV) simulation (refs. 3 and 4) used by Dynamics Control Branch (DCB) researchers.

### Equations

The algebraic, differential, and difference equations describing the Dryden turbulence model are presented in this section. These equations were developed from the Dryden spectral model contained in reference 1 and were furnished by the Government. The equations were transformed into ACSL source code and implemented in the GUSTMDL program. Comments were included in the program to correlate code with the equations in the following section by equation number.

The equations are separated according to each of the three turbulence models. The continuous model equations were implemented in the ACSL DERIVATIVE BLOCK of the GUSTMDL program. The Tustin model and MIL STD equations were implemented in the ACSL DISCRETE BLOCK named GUST.

#### *Continuous Model*

Equations (1) through (17) below define the continuous implementation of the Dryden turbulence model. In these equations the variables  $\xi_u$ ,  $\xi_v$ ,  $\xi_w$ ,  $\xi_p$ ,  $\xi_q$ ,  $\xi_r$  represent the body-axis  $u$ -,  $v$ -,  $w$ -,  $p$ -,  $q$ -, and  $r$ -components of turbulence, respectively. The variables  $v_u$ ,  $v_v$ ,  $v_w$ ,  $v_p$  represent the Gaussian noise forcing functions for the  $u$ -,  $v$ -,  $w$ -, and  $p$ -components, respectively.

Equations (1) and (2) are the differential equations defining the  $w$ -component of the turbulence.

$$\ddot{x}_w = -2\tau_w^{-1}\dot{x}_w - \tau_w^{-2}x_w + \sigma_w\tau_w^{-3/2}T_v^{-1/2}v_w \quad (1)$$

The desired root-mean-square (rms) velocity magnitude of the  $w$ -component of the turbulence is represented by  $\sigma_w$ .

$$\xi_w = x_w + \tau_w\sqrt{3}\dot{x}_w \quad \text{and} \quad \dot{\xi}_w = \dot{x}_w + \tau_w\sqrt{3}\ddot{x}_w \quad (2)$$

$$\text{where} \quad \tau_w = \frac{L_w}{V} \quad (3)$$

The  $v$ -component can be obtained from equations (1) through (2) by substituting the subscript  $v$  for the subscript  $w$ . The time constant for the  $v$ -component is given in equation (4).

$$\tau_v = \frac{L_v}{V} \quad (4)$$

The differential equation defining the  $u$ -component is

$$\dot{\xi}_u = -\frac{1}{\tau_u} \xi_u + \sigma_u \sqrt{\frac{2}{\tau_u T_v}} v_u \quad (5)$$

where  $\tau_u = \frac{L_u}{V}$  (6)

Similarly, the p-component equations are

$$\dot{\xi}_p = -\frac{1}{\tau_p} \xi_p + \sigma_p \sqrt{\frac{2}{\tau_p T_v}} v_p \quad (7)$$

where  $\sigma_p = \frac{1.9}{\sqrt{L_w b_w}} \sigma_w$  (8)

$$\tau_p = \frac{L_p}{V} \quad (9)$$

$$L_p = \frac{\sqrt{L_w b_w}}{2.6} \quad (10)$$

The differential equations defining the q-component are

$$\left. \begin{aligned} \dot{x}_q &= -\frac{V\pi}{4b_w} x_q + \frac{\pi}{4b_w} \xi_w \\ \dot{\xi}_q &= \dot{x}_q \\ &= -\frac{V\pi}{4b_w} x_q + \frac{\pi}{4b_w} \xi_w \end{aligned} \right\} \quad (11)$$

or

$$\dot{\xi}_q = -\frac{V\pi}{4b_w} \xi_q + \frac{\pi}{4b_w} \dot{\xi}_w \quad (12)$$

A time constant for equation (12) can be defined by

$$\tau_q = \frac{4b_w}{\pi V} \quad (13)$$

The rms value of the q-component for equation (12) is given approximately by

$$\sigma_q \approx \sqrt{\frac{\pi}{2L_w b_w}} \sigma_w \quad (14)$$

Similarly, the r-component equation is

$$\dot{\xi}_r = -\frac{V\pi}{3b_w} \xi_r + \frac{\pi}{3b_w} \dot{\xi}_v \quad (15)$$

A time constant for equation (15) can be defined by

$$\tau_r = \frac{3b_w}{\pi V} \quad (16)$$

The rms value of the r-component for equation (15) is given approximately by

$$\sigma_r \approx \sqrt{\frac{2\pi}{3L_w b_w}} \sigma_w \quad (17)$$

### **Tustin Model**

The Tustin model can be implemented with recursive difference equations to compute components of turbulence. The definitions of *tau* in equations (3), (4), (6), (9), (13), and (16) for the continuous model were used in the Tustin turbulence equations. Similarly the definitions of *sigma* in equations (8), (14), and (17) apply. The Gaussian noise forcing functions are the same as used in the continuous model.

The recursive difference equation to compute the u-component of the turbulence is

$$\xi_u(k) = -\left[ \frac{1 - C_{BL}\tau_u}{1 + C_{BL}\tau_u} \right] \xi_u(k-1) + \left[ \frac{\sigma_u \sqrt{\frac{2\tau_u}{T_v}}}{1 + C_{BL}\tau_u} \right] [v_u(k) + v_u(k-1)] \quad (18)$$

where  $C_{BL}$  is given by

$$C_{BL} = \frac{1}{\tau_u} \cot\left(\frac{T_v}{2\tau_u}\right) \quad (19)$$

The recursive difference equation to compute the w-component is

$$\begin{aligned} \xi_w(k) = & -\frac{2(\omega_w^2 - C_{BL}^2)}{(\omega_w + C_{BL})^2} \xi_w(k-1) - \frac{(\omega_w - C_{BL})^2}{(\omega_w + C_{BL})^2} \xi_w(k-2) \\ & + \frac{\sigma_w \sqrt{\frac{3\omega_w}{T_v}}}{(\omega_w + C_{BL})^2} \left[ \left( C_{BL} + \frac{\omega_w}{\sqrt{3}} \right) v_w(k) + \frac{2\omega_w}{\sqrt{3}} v_w(k-1) + \left( \frac{\omega_w}{\sqrt{3}} - C_{BL} \right) v_w(k-2) \right] \end{aligned} \quad (20)$$

The v-component can be obtained from equation (20) by substituting the subscript *v* for the subscript *w*.

The recursive difference equation to compute the p-component of the turbulence is

$$\xi_p(k) = - \left[ \frac{1 - C_{BL_p} \tau_p}{1 + C_{BL_p} \tau_p} \right] \xi_p(k-1) + \left[ \frac{\sigma_p \sqrt{\frac{2\tau_p}{T_v}}}{1 + C_{BL_p} \tau_p} \right] [v_p(k) + v_p(k-1)] \quad (21)$$

where

$$C_{BL_p} = \frac{1}{\tau_p} \cot \left( \frac{T_v}{2\tau_p} \right) \quad (22)$$

The difference equation for  $\xi_q(k)$  is

$$\begin{aligned} \xi_q(k) = & - \left[ \frac{1 - 4b_w C_{BL_q} / \pi V}{1 + 4b_w C_{BL_q} / \pi V} \right] \xi_q(k-1) \\ & + \left[ \frac{C_{BL_q}}{V(1 + 4b_w C_{BL_q} / \pi V)} \right] [\xi_w(k) - \xi_w(k-1)] \end{aligned} \quad (23)$$

where

$$\begin{aligned} C_{BL_q} &= \frac{1}{\tau_q} \cot \left( \frac{T_v}{2\tau_q} \right) \\ &= \frac{\pi V}{4b_w} \cot \left( \frac{\pi V T_v}{8b_w \tau_q} \right) \end{aligned} \quad (24)$$

The equations for the r-component are identical to those for the q-component except that the factor  $(4b_w/\pi)$  in equations (23) and (24) is replaced by the factor  $(3b_w/\pi)$ . The resulting difference equation for  $\xi_r$  is

$$\begin{aligned} \xi_r(k) = & - \left[ \frac{1 - 3b_w C_{BL_r} / \pi V}{1 + 3b_w C_{BL_r} / \pi V} \right] \xi_r(k-1) \\ & + \left[ \frac{C_{BL_r}}{V(1 + 3b_w C_{BL_r} / \pi V)} \right] [\xi_v(k) - \xi_v(k-1)] \end{aligned} \quad (25)$$

where

$$\begin{aligned}
C_{BLr} &= \frac{1}{\tau_r} \cot\left(\frac{T_v}{2\tau_r}\right) \\
&= \frac{\pi V}{3b_w} \cot\left(\frac{\pi V T_v}{6b_w \tau_q}\right)
\end{aligned} \tag{26}$$

The simple difference equation for the derivative of each turbulence component is

$$\dot{\xi}(k) = \frac{\xi(k) - \xi(k-1)}{T_v} \tag{27}$$

The difference equation form for the derivative of the u-component is

$$\dot{\xi}_u(k) = -\frac{1 - \tau_u C_{BL}}{1 + \tau_u C_{BL}} \dot{\xi}_u(k-1) + \sigma_u \sqrt{\frac{2\tau_u}{T_v}} \frac{C_{BL}}{1 + \tau_u C_{BL}} \{v_u(k) - v_u(k-1)\} \tag{28}$$

The difference equation form for the derivative of the w-component is

$$\begin{aligned}
\dot{\xi}_w(k) &= -2 \left( \frac{1 - \tau_w C_{BL}}{1 + \tau_w C_{BL}} \right) \dot{\xi}_w(k-1) - \left( \frac{1 - \tau_w C_{BL}}{1 + \tau_w C_{BL}} \right)^2 \dot{\xi}_w(k-2) + \frac{\sigma_w \sqrt{\frac{\tau_w}{T_v}} C_{BL}}{(1 + \tau_w C_{BL})^2} \\
&\quad \times \left\{ (1 + \sqrt{3} \tau_w C_{BL}) v_w(k) - 2\sqrt{3} \tau_w C_{BL} v_w(k-1) - (1 - \sqrt{3} \tau_w C_{BL}) v_w(k-2) \right\}
\end{aligned} \tag{29}$$

### MIL STD Model

The difference equations defining the MIL STD model were obtained from reference 1. Equations (30) through (35) were furnished by the Government and implemented to calculate the u-, v-, w-, p-, q-, and r-components of turbulence. The definitions of *tau* and *sigma* for the continuous model were also used in the MIL STD turbulence equations. Again, the Gaussian noise forcing functions are the same ones used in the continuous model.

$$\xi_u(k) = \left(1 - \frac{T_v}{\tau_u}\right) \xi_u(k-1) + \sigma_u \sqrt{\frac{2T_v}{\tau_u}} v_u(k) \tag{30}$$

$$\xi_v(k) = \left(1 - \frac{2T_v}{\tau_v}\right) \xi_v(k-1) + \sigma_v \sqrt{\frac{4T_v}{\tau_v}} v_v(k) \tag{31}$$

$$\xi_w(k) = \left(1 - \frac{2T_v}{\tau_w}\right) \xi_w(k-1) + \sigma_w \sqrt{\frac{4T_v}{\tau_w}} v_w(k) \tag{32}$$

$$\xi_p(k) = \left(1 - \frac{T_v}{\tau_p}\right) \xi_p(k-1) + \sigma_p \sqrt{\frac{2T_v}{\tau_p}} v_p(k) \tag{33}$$

$$\xi_q(k) = \left(1 - \frac{T_v}{\tau_q}\right) \xi_q(k-1) + \frac{\pi}{4b_w} [\xi_w(k) - \xi_w(k-1)] \quad (34)$$

$$\xi_r(k) = \left(1 - \frac{T_v}{\tau_r}\right) \xi_r(k-1) + \frac{\pi}{3b_w} [\xi_v(k) - \xi_v(k-1)] \quad (35)$$

## Variable Definition

Table 1 correlates the algebraic symbols used in the equations with variable names used in coding the test program GUSTMDL. Variables are listed for each of the three implemented turbulence models. The equation number column was included as a reference to the equations listed in the previous section. Comments are included in the GUSTMDL code to help the reader identify the equations.

Table 1. Correlation between Algebraic Symbol and ACSL/FORTRAN Variable

| Symbol     | Turbulence Model |        |         | Equation no. |
|------------|------------------|--------|---------|--------------|
|            | Continuous       | Tustin | MIL STD |              |
| $v_p$      | FILNP            |        |         |              |
| $v_p(k)$   |                  | FILNP  | FILNP   |              |
| $v_u$      | FILNU            |        |         |              |

## Code

The ACSL/FORTRAN source code for the GUSTMDL program (file GUSTMDL.CSL) is presented in this section. The program has MACRO, INITIAL, DYNAMIC, and TERMINAL BLOCKS. The DYNAMIC BLOCK is composed of the DERIVATIVE and DISCRETE BLOCKS. The three DISCRETE BLOCKS are the GUST, DISCRMS, and ASC. The continuous turbulence model is implemented in the DERIVATIVE BLOCK, and the Tustin and MIL STD models are implemented in the DISCRETE GUST BLOCK. Initialization of variables and variables that need to be calculated only one time are implemented in the INITIAL BLOCK. The DISCRETE BLOCK DISCRMS calls a macro to define root mean square and mean statistics for the variables in the three turbulence models. The DISCRETE BLOCK ASC calls FORTRAN subroutines ASCFM and WSTATS which are used to output variables for analysis in a format that is compatible with tools utilized by the DCB researchers.

## Time History Plots

Numerous 100-second runs were made with the GUSTMDL test program to produce turbulence sequences for analysis of the continuous, Tustin, and MIL STD turbulence models. Simulated aircraft velocities of 100 ft/sec and 1000 ft/sec were used. Sample time history plots of the first 10 seconds of these sequences for each model are included in figures 1 through 3 for  $V = 100$  ft/sec and in figures 4 through 6 for  $V = 1000$  ft/sec.

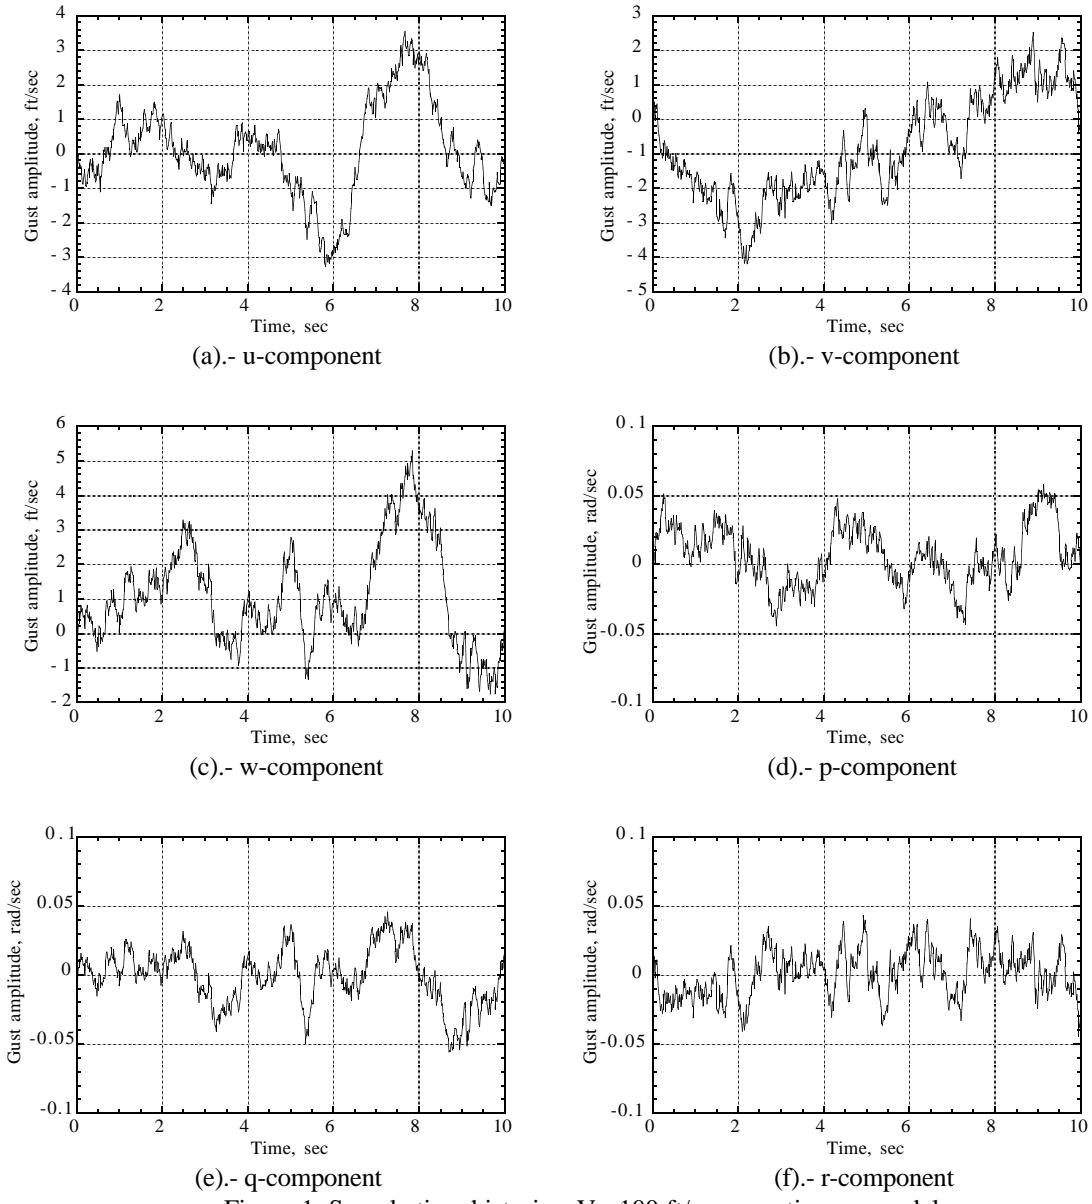

Figure 1. Sample time histories;  $V = 100$  ft/sec - continuous model.

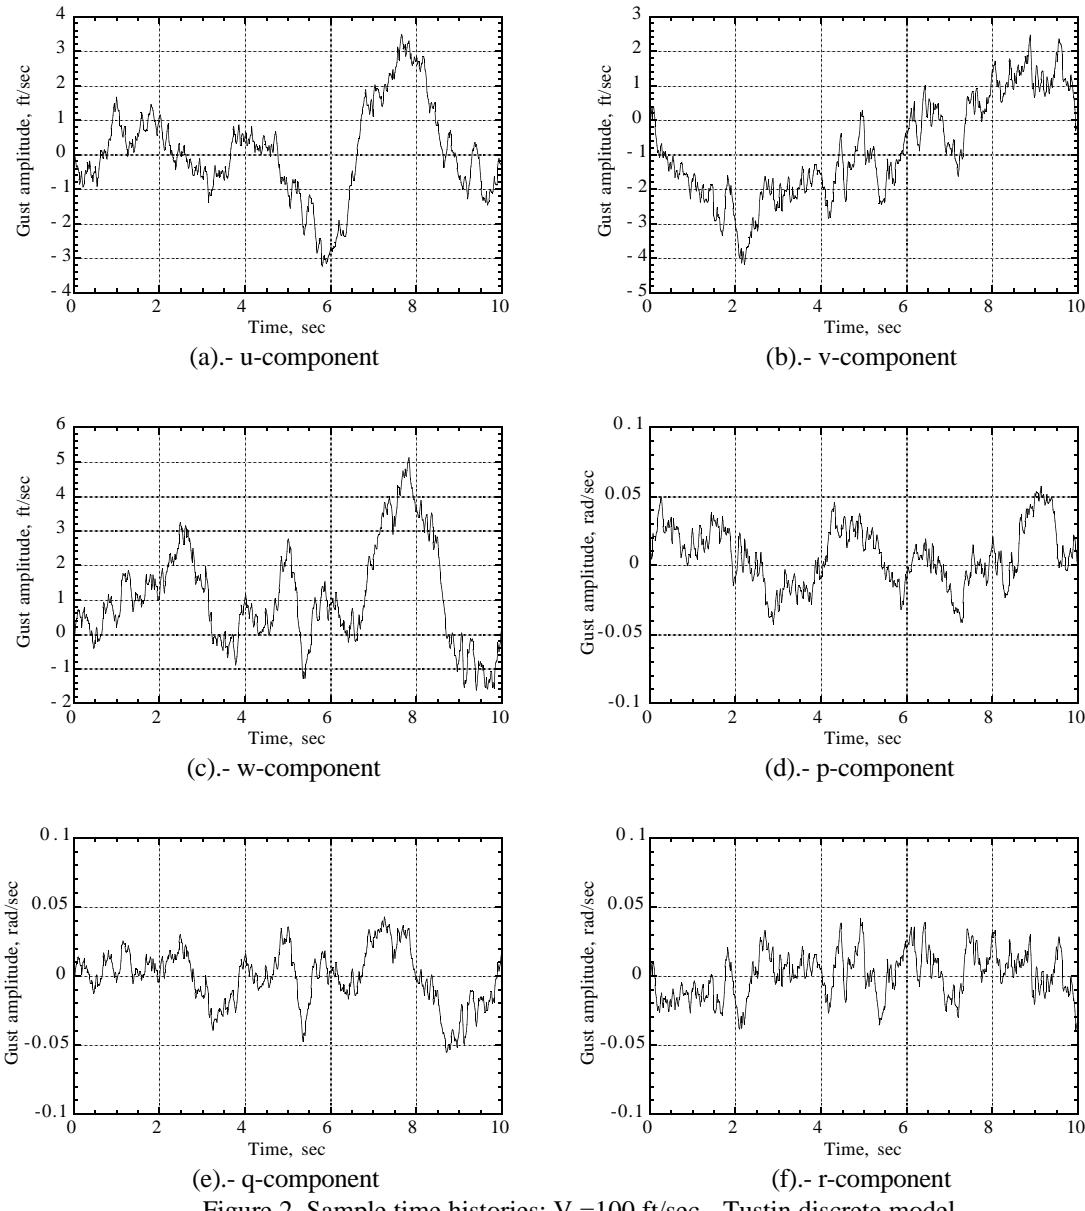

Figure 2. Sample time histories;  $V = 100$  ft/sec - Tustin discrete model.

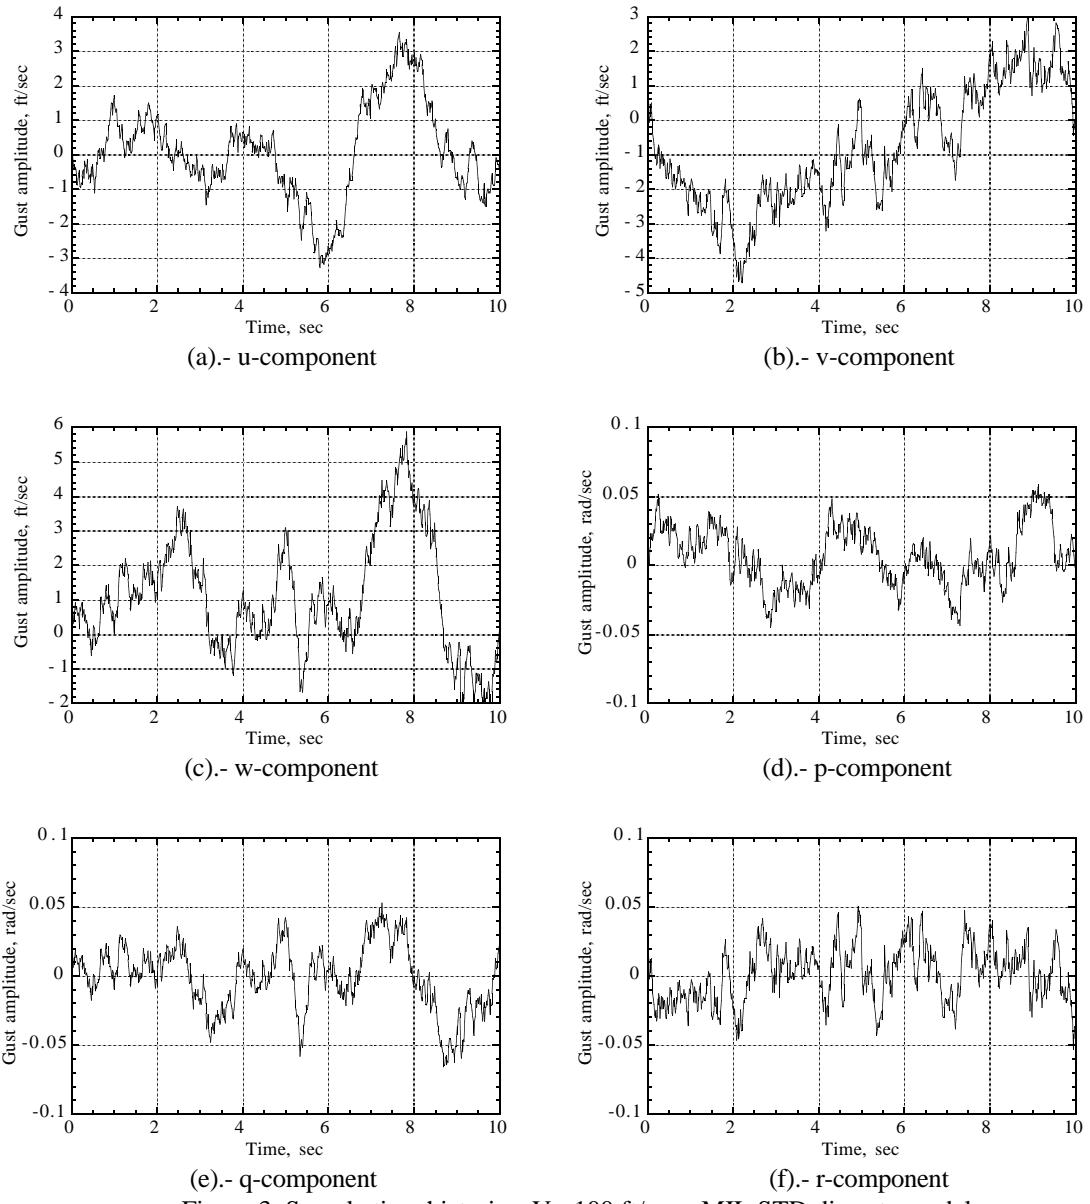

Figure 3. Sample time histories;  $V = 100$  ft/sec - MIL STD discrete model.

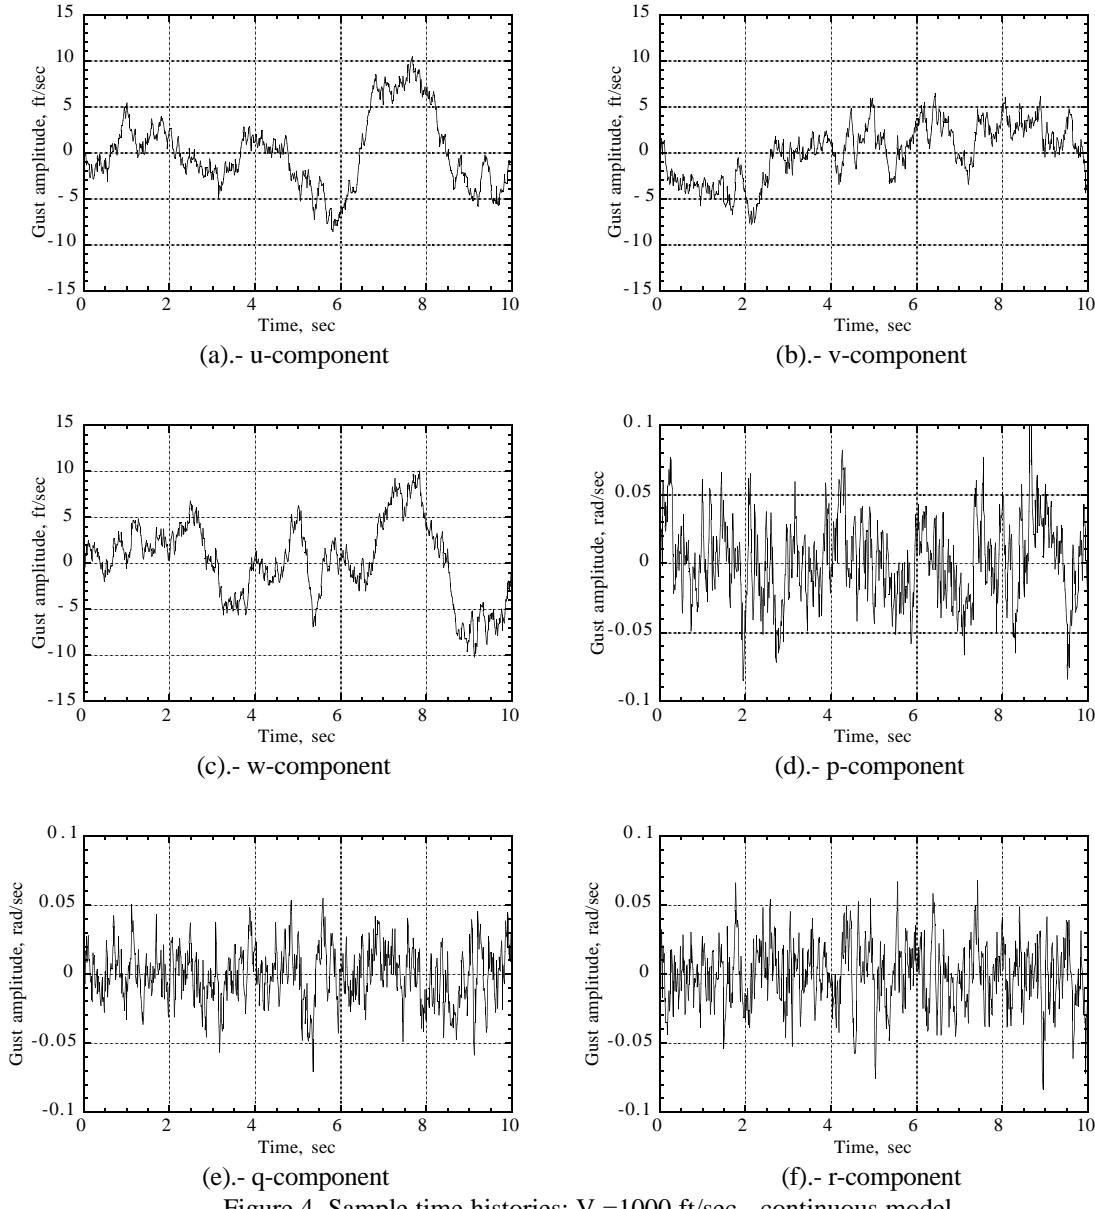

Figure 4. Sample time histories;  $V = 1000$  ft/sec - continuous model.

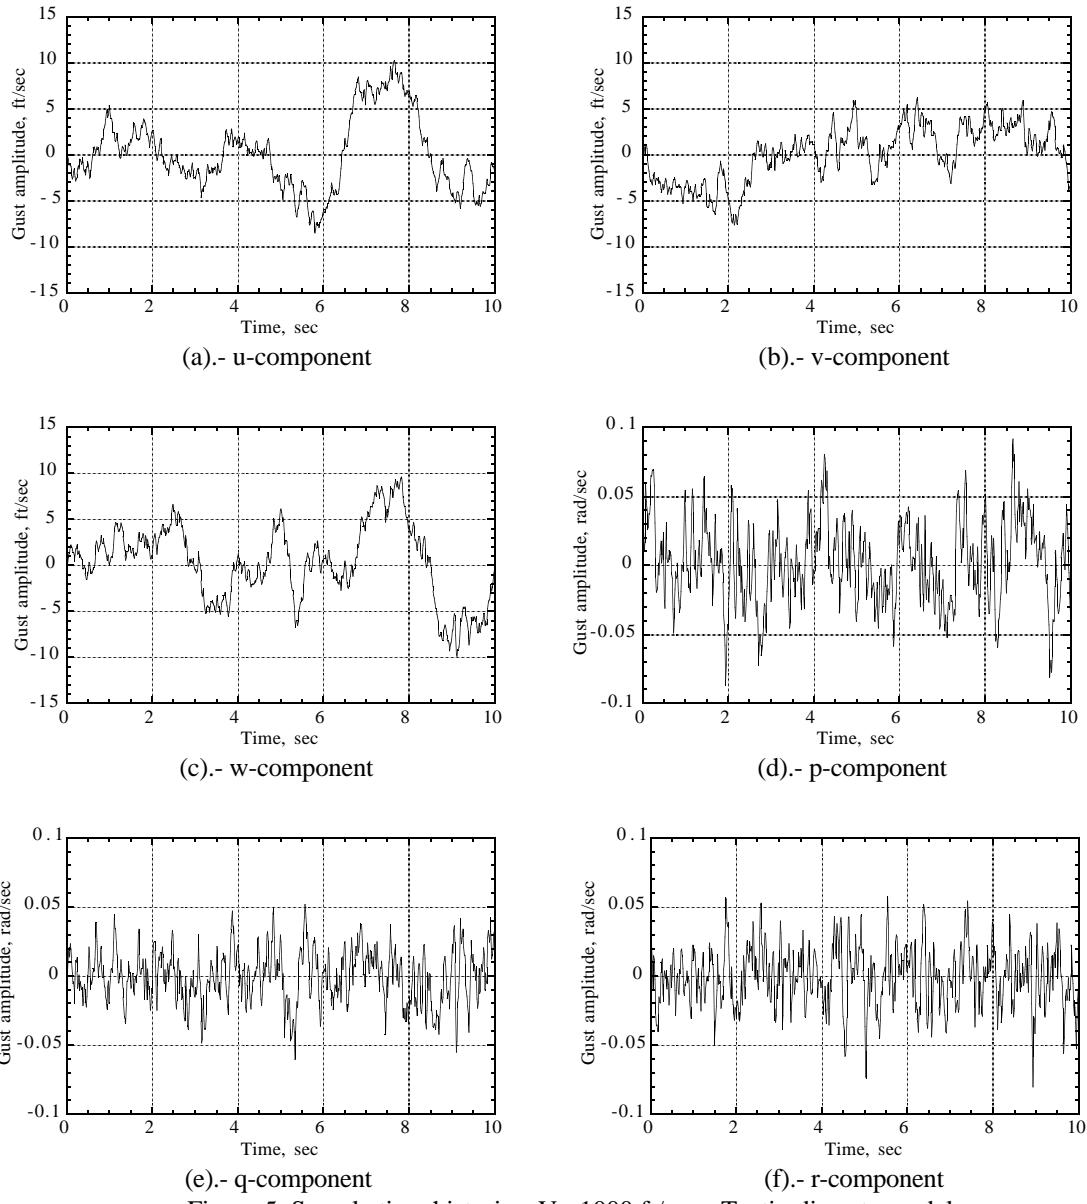

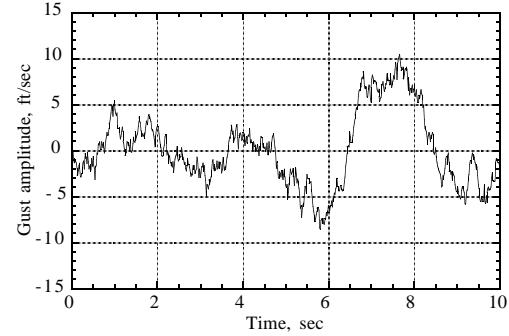

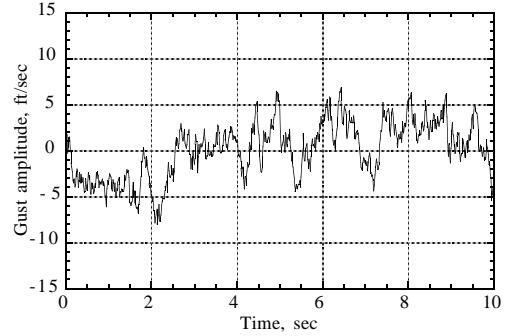

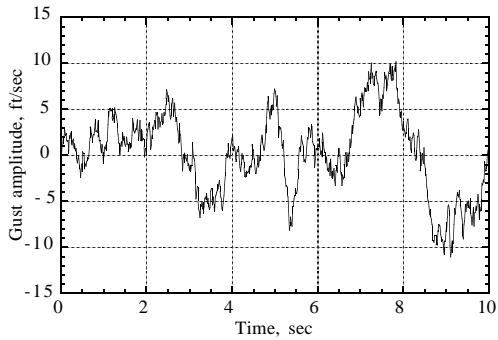

Figure 5. Sample time histories;  $V = 1000$  ft/sec - Tustin discrete model.

(f).- r-component

Figure 6. Sample time histories;  $V = 1000$  ft/sec - MIL STD discrete model.

## Power Spectral Densities

Performance of the three implemented turbulence models was evaluated by computing the power spectral densities (PSD) of results of simulated turbulence from the GUSTMDL program. These PSD's of the simulated turbulence components were then compared to the theoretical Dryden spectral model components. Equations used to compute the PSD for each model are listed in the section below, and the MATLAB m-files used to implement these equations and produce the PSD plots follow in the next section.

## Equations

The two-sided theoretical power spectral densities for the continuous model were provided by the Government from the Dryden model (ref. 1) and are listed below as equations (36) through (41).

$$S_u(\omega) = \frac{\sigma_u^2 \tau_u}{\pi} \frac{1}{1 + (\tau_u \omega)^2} \quad (36)$$

$$S_v(\omega) = \frac{1}{2} \tilde{\Phi}_v(\omega) = \frac{\sigma_v^2 \tau_v}{2\pi} \frac{1 + 3(\tau_v \omega)^2}{(1 + (\tau_v \omega)^2)^2} \quad (37)$$

$$S_w(\omega) = \frac{1}{2} \tilde{\Phi}_w(\omega) = \frac{\sigma_w^2 \tau_w}{2\pi} \frac{1 + 3(\tau_w \omega)^2}{(1 + (\tau_w \omega)^2)^2} \quad (38)$$

$$S_p(\omega) = \frac{\sigma_p^2 \tau_p}{\pi} \frac{1}{1 + (\tau_p \omega)^2} \quad (39)$$

$$S_q(\omega) = \frac{(\omega/V)^2}{1 + [(4b_w/\pi)(\omega/V)]^2} S_w(\omega) \quad (40)$$

$$S_r(\omega) = \frac{(\omega/V)^2}{1 + [(3b_w/\pi)(\omega/V)]^2} S_v(\omega) \quad (41)$$

The theoretical power spectral densities for the Tustin model were provided by the Government and are listed below as equations (42) through (51).

$$G_{du}(\omega) = \frac{T_v}{2\pi} \left| H_u(e^{j\omega T_v}) \right|^2 = \frac{\sigma_u^2 \omega_u}{\pi} \frac{[1 + \cos(\omega T_v)]}{(\omega_u^2 + C_{BL}^2) + (\omega_u^2 - C_{BL}^2) \cos(\omega T_v)} \quad (42)$$

$$\begin{aligned} G_{di}(\omega) &= \frac{T_v}{2\pi} \left| H_i(e^{j\omega T_v}) \right|^2 \quad \text{for } i = v, w \\ &= \frac{K_i^2 \sigma_i^2 [a^2 + b^2 + c^2 + 2(ab + bc) \cos(\omega T_v) + 2ac \cos(2\omega T_v)]}{d^2 + e^2 + f^2 + 2(de + ef) \cos(\omega T_v) + 2df \cos(2\omega T_v)} \end{aligned} \quad (43)$$

$$\left. \begin{array}{l}
\omega_i = V/L_i \\
K_i = \sqrt{\frac{3\omega_i}{2\pi}} \\
a = C_{BL} + \omega_i/\sqrt{3} \\
b = 2\omega_i/\sqrt{3} \\
c = \omega_i/\sqrt{3} - C_{BL} \\
d = (\omega_i + C_{BL})^2 \\
e = 2(\omega_i^2 - C_{BL}^2) \\
f = (\omega_i - C_{BL})^2
\end{array} \right\} \quad \text{for } i = v, w \quad (44)$$

where

$$G_{dp}(\omega) = \frac{T_v}{2\pi} \left| H_p \left( e^{j\omega T_v} \right) \right|^2 = \frac{\sigma_p^2 \omega_p}{\pi} \frac{[1 + \cos(\omega T_v)]}{\left( \omega_p^2 + C_{BL,p}^2 \right) + \left( \omega_p^2 - C_{BL,p}^2 \right) \cos(\omega T_v)} \quad (45)$$

$$G_{dq}(\omega) = \left| H_q \left( e^{j\omega T_v} \right) \right|^2 G_{dw}(\omega) \quad (46)$$

$$\left. \begin{array}{l}
\text{where} \\
\left| H_q \left( e^{j\omega T_v} \right) \right|^2 = \frac{2C_{BL,q}^2}{V^2} \frac{1 - \cos(\omega T_v)}{M_{q+}^2 + M_{q-}^2 + 2M_{q+}M_{q-} \cos(\omega T_v)}
\end{array} \right\} \quad (47)$$

$$\left. \begin{array}{l}
\text{and} \\
M_{q+} = 1 + \tau_q C_{BL,q} \\
M_{q-} = 1 - \tau_q C_{BL,q}
\end{array} \right\} \quad (48)$$

$$G_{dr}(\omega) = \left| H_r \left( e^{j\omega T_v} \right) \right|^2 G_{dv}(\omega) \quad (49)$$

$$\left. \begin{array}{l}
\text{where} \\
\left| H_r \left( e^{j\omega T_v} \right) \right|^2 = \frac{2C_{BL,r}^2}{V^2} \frac{1 - \cos(\omega T_v)}{M_{r+}^2 + M_{r-}^2 + 2M_{r+}M_{r-} \cos(\omega T_v)}
\end{array} \right\} \quad (50)$$

$$\left. \begin{array}{l}
\text{and} \\
M_{r+} = 1 + \tau_r C_{BL,r} \\
M_{r-} = 1 - \tau_r C_{BL,r}
\end{array} \right\} \quad (51)$$

The theoretical power spectral densities for the MIL STD model were provided by the Government and are listed below as equations (52) through (57).

$$\begin{aligned}
G_{di}(\omega) &= \frac{T_v}{2\pi} \left| H_i \left( e^{j\omega T_v} \right) \right|^2 \\
&= \frac{\frac{T_v^2}{\pi\tau_i} \sigma_i^2}{1 + (1 - a_i)^2 - 2(1 - a_i)\cos(\omega T_v)} \quad \text{for } i = u, v, w, p \quad (52)
\end{aligned}$$

$$\begin{aligned}
H_i \left( e^{j\omega T_v} \right) &= \frac{\sigma_u \sqrt{2a_i}}{1 - (1 - a_i)e^{-j\omega T_v}} \quad \text{for } i = u, v, w, p \quad (53) \\
\text{where} \quad &= \frac{\sigma_u \sqrt{2a_i}}{[1 - (1 - a_i)\cos(\omega T_v)] - j(1 - a_i)\sin(\omega T_v)}
\end{aligned}$$

$$\begin{aligned}
\text{and} \quad & \left. \begin{aligned} a_u &= \frac{T_v}{\tau_u} \\ a_v &= \frac{2T_v}{\tau_v} \\ a_w &= \frac{2T_v}{\tau_w} \\ a_p &= \frac{T_v}{\tau_p} \end{aligned} \right\} \quad (54)
\end{aligned}$$

$$\begin{aligned}
G_{di}(\omega) &= \frac{T_v}{2\pi} \left| H_i \left( e^{j\omega T_v} \right) \right|^2 \quad \text{for } i, j = q, w \text{ or } r, v \\
&= \frac{\frac{T_v}{2\pi} k_i^2 k_j^2 [2 - 2\cos(\omega T_v)]}{(1 + X^2 + Y^2) - 2X(1 + Y)\cos(\omega T_v) + 2Y\cos(2\omega T_v)} \quad (55)
\end{aligned}$$

$$\begin{aligned}
\text{where} \quad & H_i(z) = \frac{\xi_i(z)}{v_j(z)} \quad \text{for } i, j = q, w \text{ or } r, v \\
&= \frac{k_i k_j (1 - z^{-1})}{1 - (2 - a_i - a_j)z^{-1} + (1 - a_i)(1 - a_j)z^{-2}} \quad (56) \\
&= \frac{k_i k_j (1 - z^{-1})}{1 - Xz^{-1} + Yz^{-2}}
\end{aligned}$$

$$\left. \begin{array}{l}
a_q = \frac{T_v}{\tau_q} \\
a_r = \frac{T_v}{\tau_r} \\
k_q = \frac{\pi}{4b_w} \\
k_r = \frac{\pi}{3b_w} \\
k_v = \sigma_v \sqrt{\frac{4T_v}{\tau_v}} \\
k_w = \sigma_w \sqrt{\frac{4T_v}{\tau_w}} \\
X = 2 - a_i - a_j \\
Y = (1 - a_i)(1 - a_j)
\end{array} \right\} \quad \text{for } i, j = q, w \text{ or } r, v \quad (57)$$

and

### Code

The PSD equations listed in the previous section were coded into MATLAB m-file *fig12dat.m*. Time history sequences from the GUSTMDL simulation were input using the gdload utility avoiding conversion of input files prior to use of the MATLAB m-files. Execution of *fig12dat.m* required assigning a value for the velocity *V* to correspond with the velocity used in the input file obtained from the GUSTMDL program. Using the gdwrite utility, the m-file produces output files in the asc2 format which is compatible with one of the plotting programs used by the DCB researchers. Source code for the m-file *fig12dat.m* is presented below.

### **Plots**

PSD's of sample sequences of each turbulence component were produced using *fig12dat.m* for each of the three models. These data were input into a commercial plotting program, and the resulting plots are shown below in figures 7 through 12. These plots compare the sample PSD and theoretical PSD for each of the turbulence sequences that were shown in figures 1 through 6.

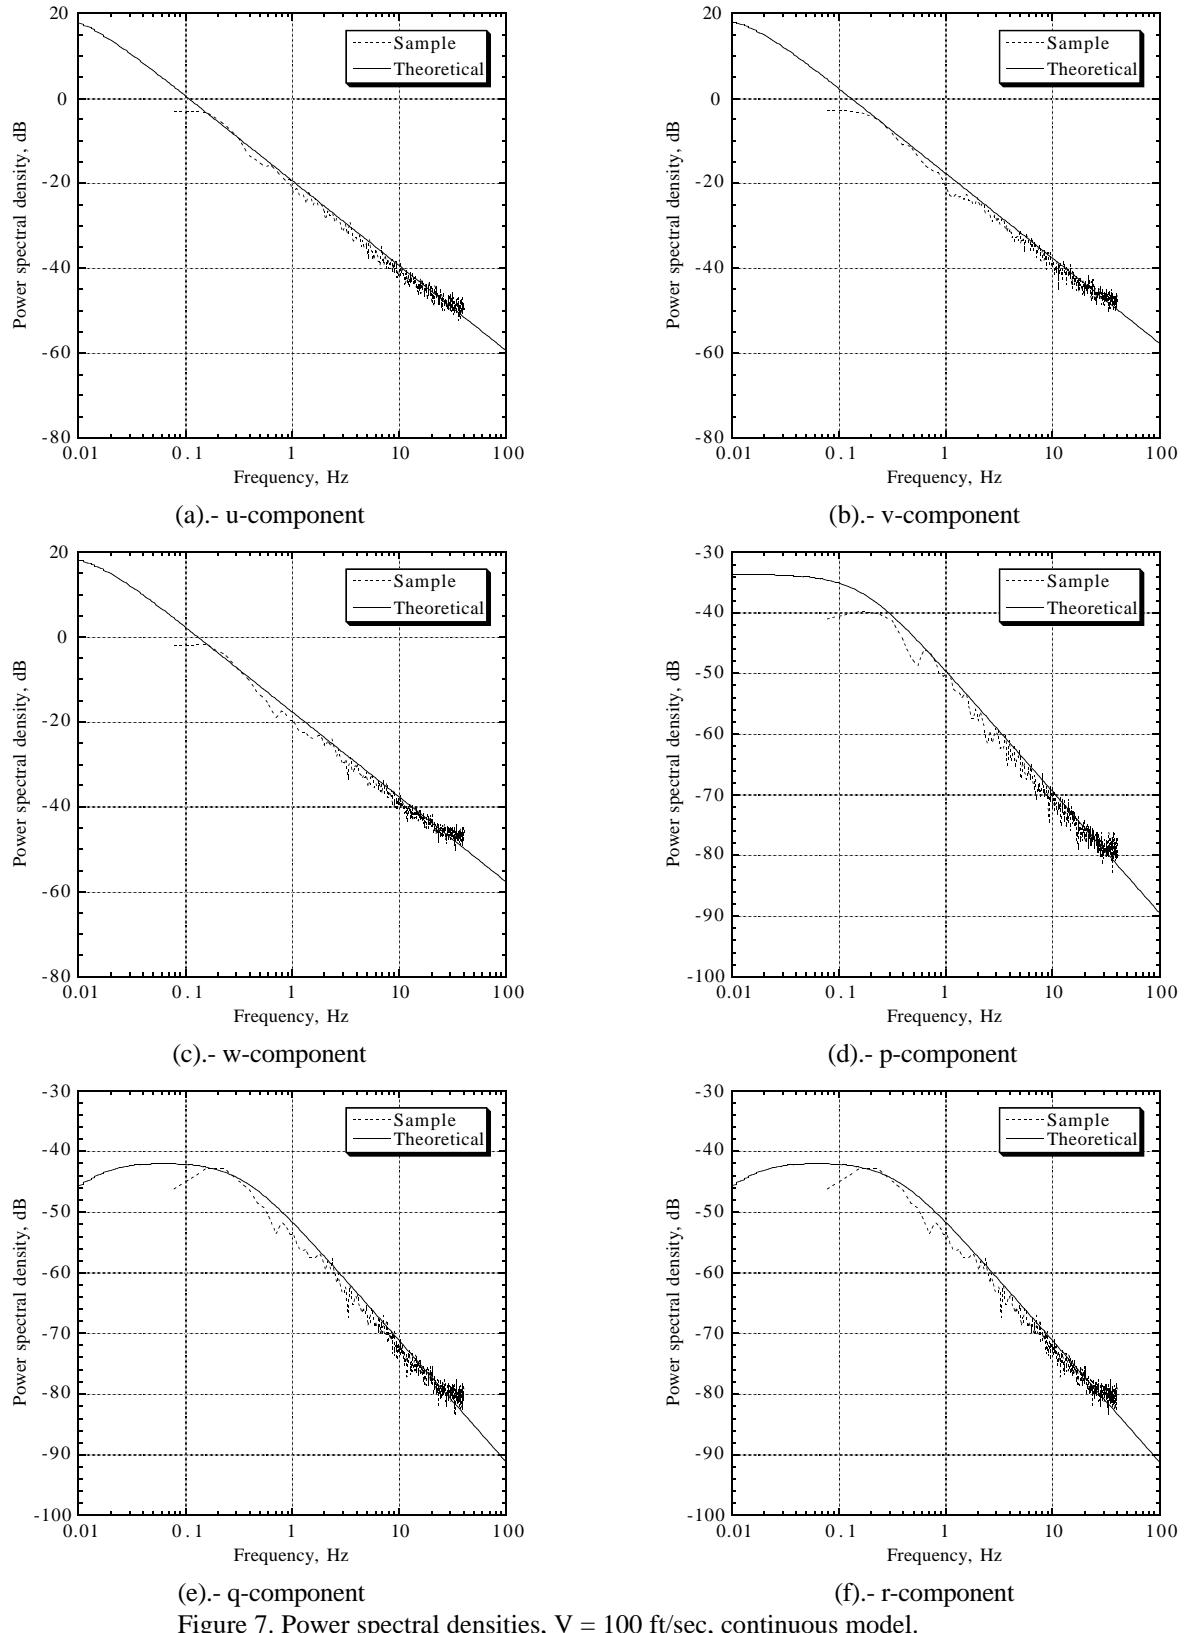

Figure 7. Power spectral densities,  $V = 100$  ft/sec, continuous model.

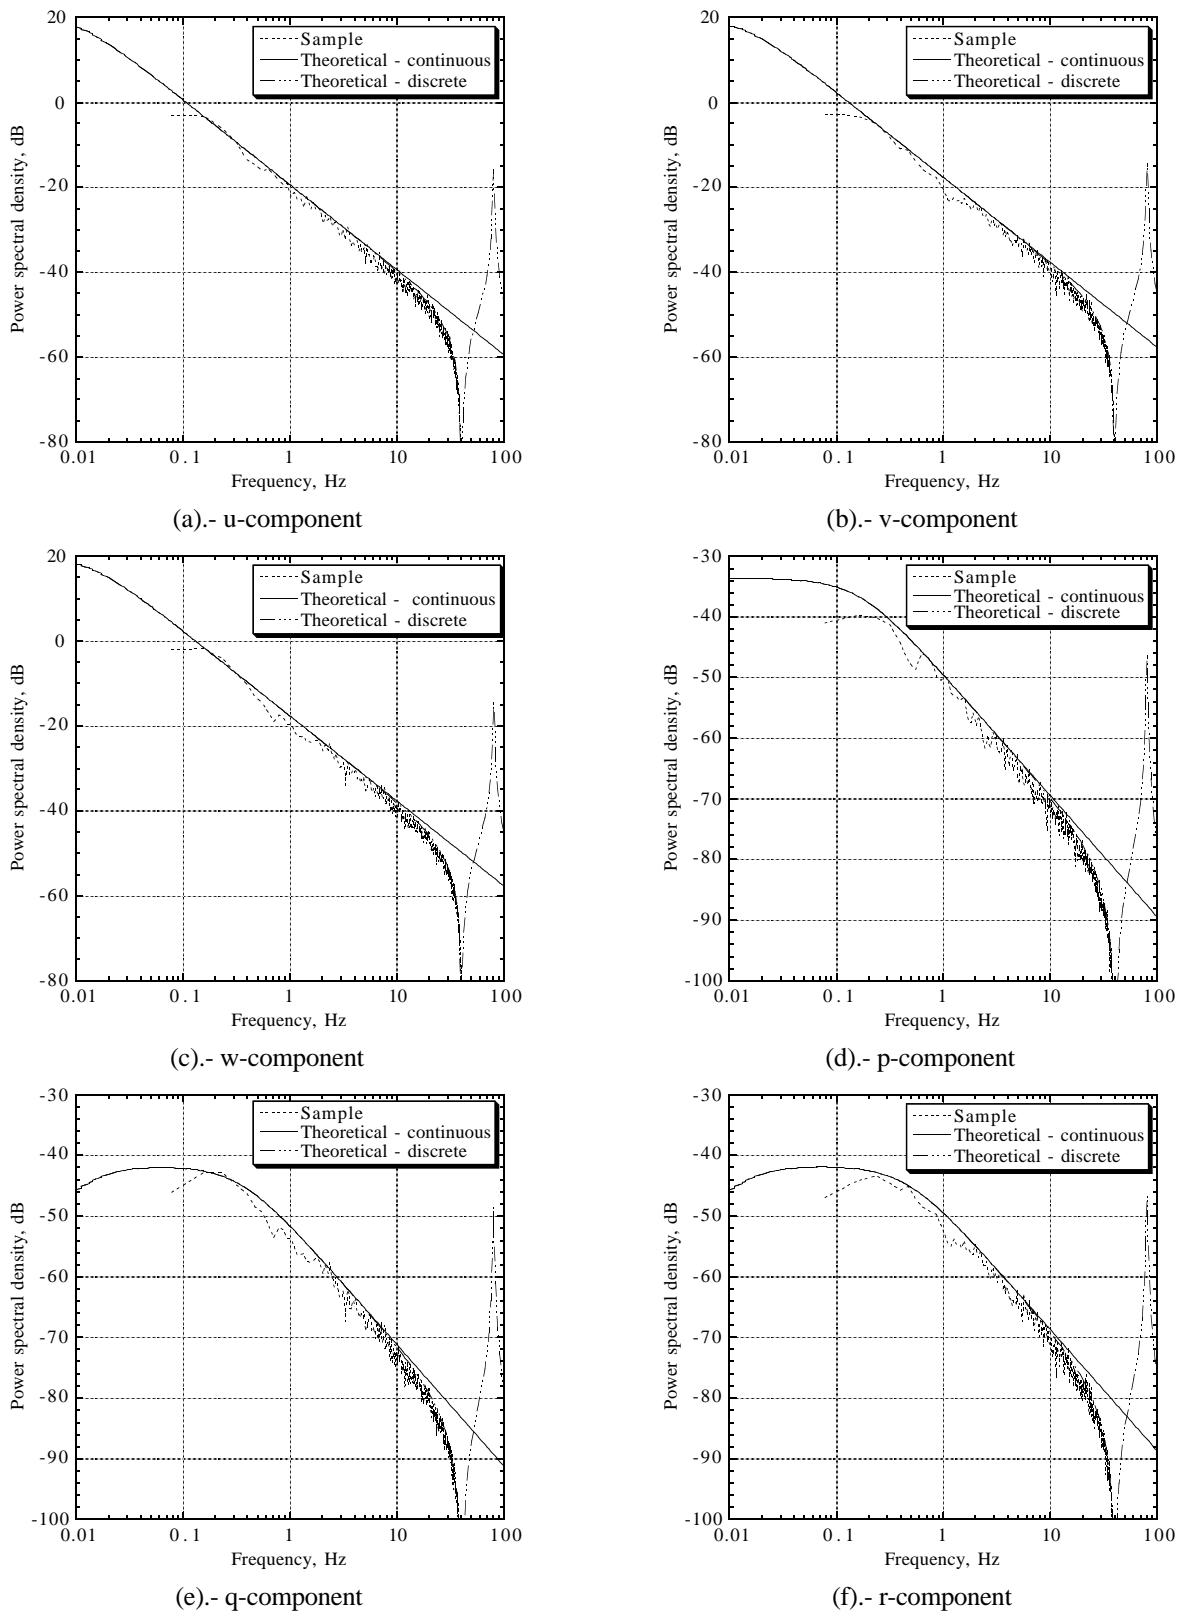

Figure 8. Power spectral densities,  $V = 100$  ft/sec, Tustin model.

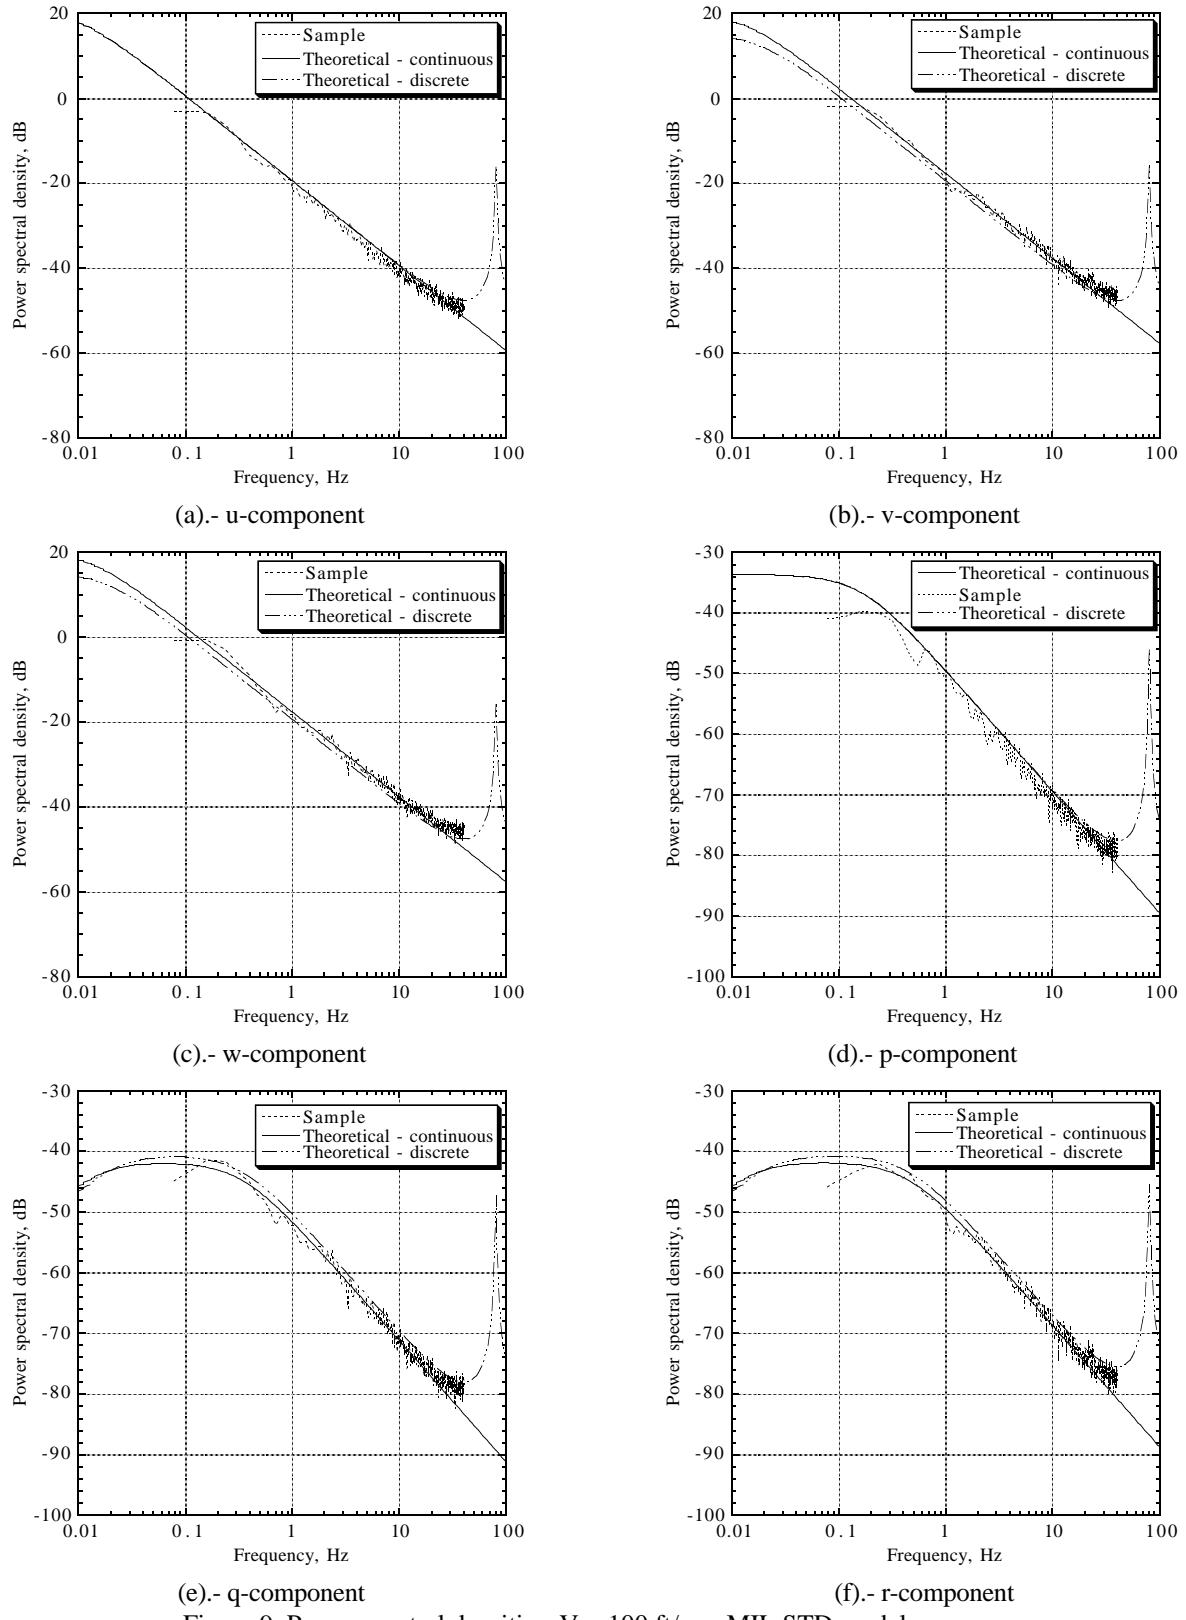

Figure 9. Power spectral densities,  $V = 100$  ft/sec, MIL STD model.

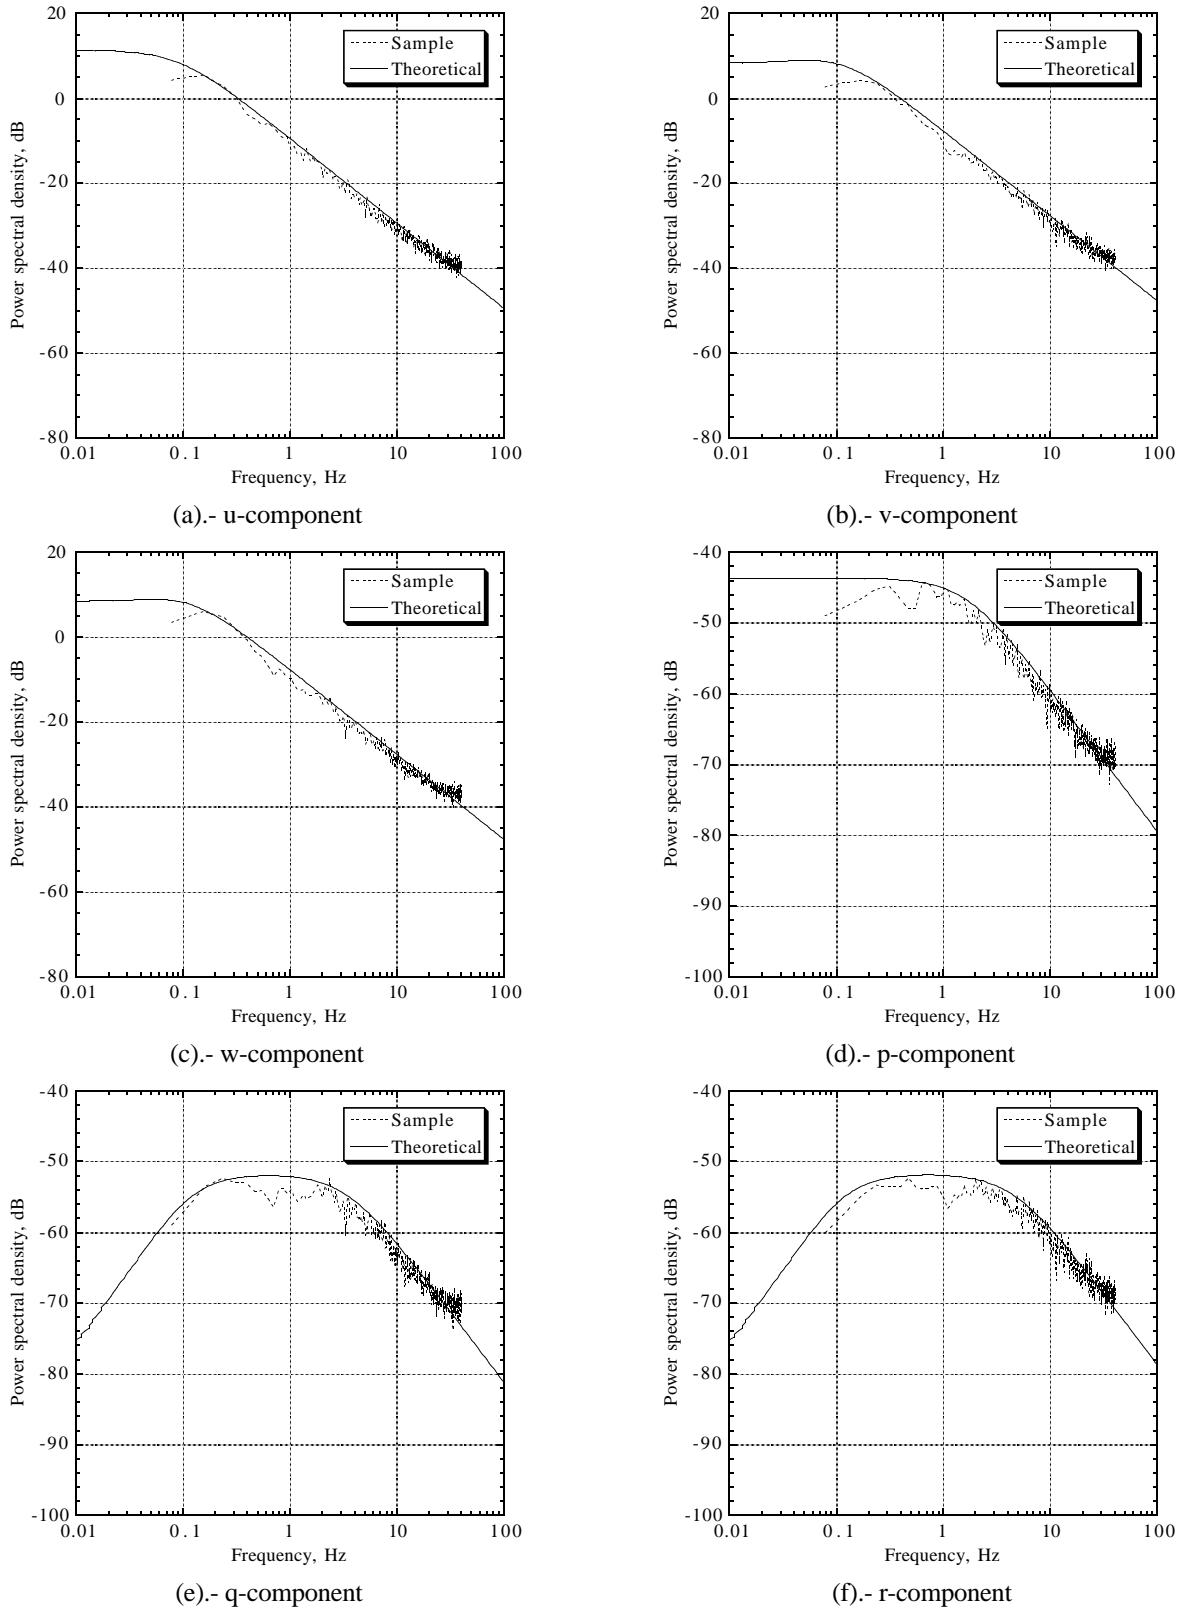

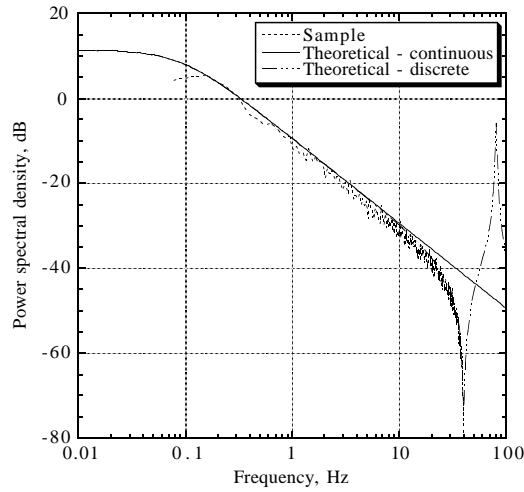

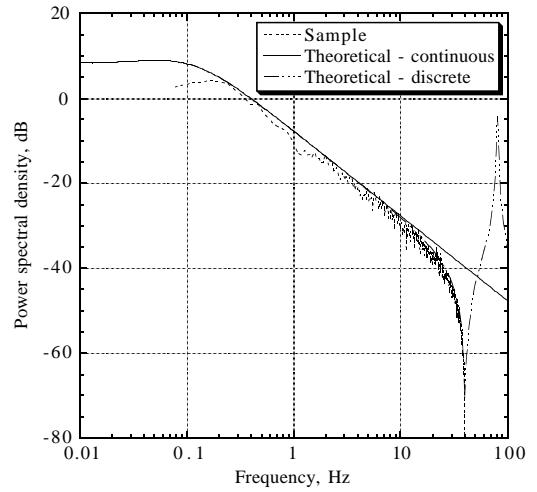

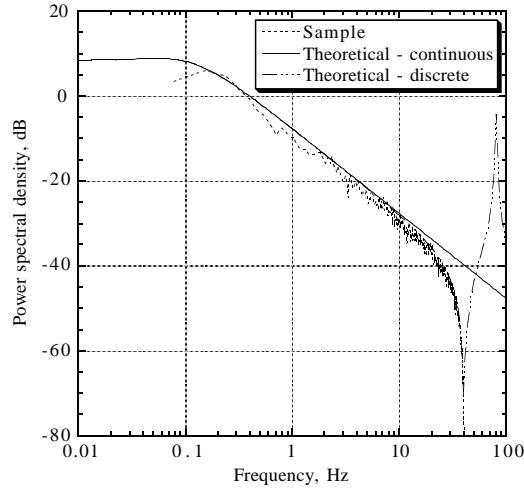

Figure 10. Power spectral densities,  $V = 1000$  ft/sec, continuous model.

(b).- v-component

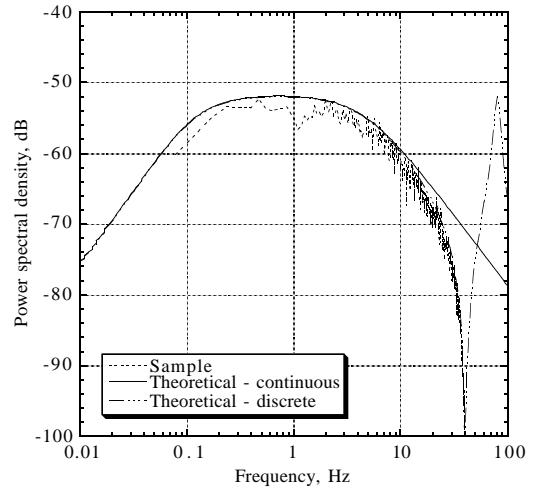

(c).- w-component

(d).- p-component

(e).- q-component

(f).- r-component

Figure 11. Power spectral densities,  $V = 1000$  ft/sec, Tustin model.

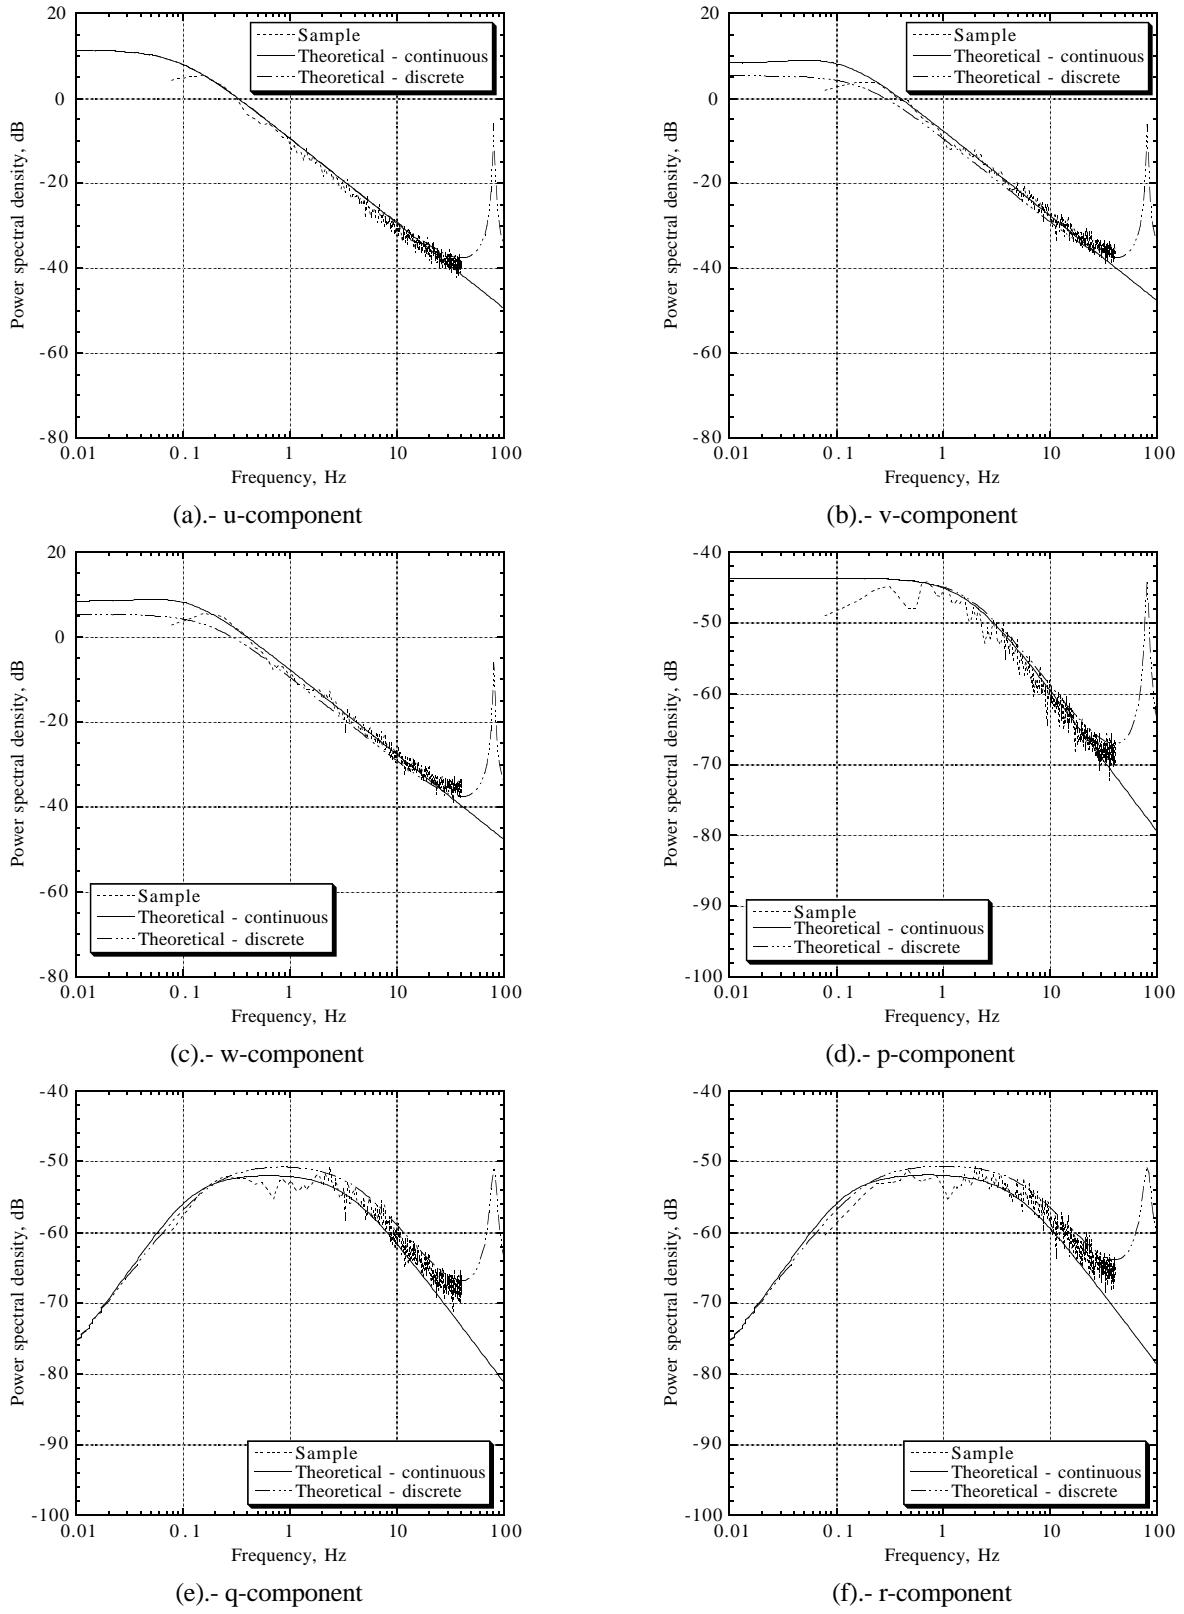

Figure 12. Power spectral densities,  $V = 1000$  ft/sec, MIL STD model.

## Measured Statistics

To evaluate the statistical accuracy of the simulated turbulence components extended runs were made with the GUSTMDL program. Each run was 1000 seconds long to reduce start-up effects and reduce the variance of sample statistics. A set of ten computer runs each using a different seed for the random noise generator was made using a velocity of 100 ft/sec and the parameter values identical to those for figures 1 through 6. A second set of runs using a velocity of 1000 ft/sec was generated. Sample statistics (rms and mean values) were calculated for each component of turbulence for each of the implemented models by invoking the DRMS macro of the GUSTMDL program.

### Equations

Sample statistics (mean  $\hat{m}_{\xi_i}^{(j)}$  and standard deviation  $\hat{\sigma}_{\xi_i}^{(j)}$ ) were computed for each sequence for each computer run according to

$$\hat{m}_{\xi_i}^{(j)} = \frac{1}{N} \sum_{k=1}^N \xi_i(k); \quad i = u, v, w, p, q, r; \quad j = 1, 2, \dots, 10 \quad (58)$$

$$\hat{\sigma}_{\xi_i}^{(j)} = \sqrt{\frac{1}{(N-1)} \sum_{k=1}^N \left\{ \xi_i^{(j)}(k) - \hat{m}_{\xi_i}^{(j)} \right\}^2} \quad (59)$$

Also computed were the mean  $\hat{M}_g$  and standard deviation  $\hat{\Sigma}_g$  of the sample means and sample standard deviations taken over the set of ten sequences for each component as follows:

$$\hat{M}_g = \frac{1}{10} \sum_{j=1}^{10} g^{(j)} \quad (60)$$

$$\hat{\Sigma}_g = \sqrt{\frac{1}{(10-1)} \sum_{j=1}^{10} \left\{ g^{(j)} - \hat{M}_g \right\}^2} \quad (61)$$

where  $g = \hat{m}_{\xi_i}$  or  $\hat{\sigma}_{\xi_i}$ ;  $i = u, v, w, p, q, r$ .

## Results

Results computed using equations (58) and (59) can be found in Tables 2 through 7. Sample means and standard deviations of each turbulence component for each of the ten 1000-second runs are shown for the continuous, Tustin, and MIL STD models. Also shown in the tables are the mean and standard deviation of the sample means and sample standard deviations taken over the set of ten sequences for each component using equations (60) and (61).

## Theoretical Statistics

Theoretical, or expected, values for the sample statistics were desired for comparison with the measured values in Tables 2 through 7. This section presents the equations used for these calculations, the code implementing these equations, and results obtained in the form of tabulated data and plots.

### Equations

The following equations defining the theoretical statistics were provided by the Government for implementation and computation. Equations (62) through (64) calculate the theoretical standard deviation of sample means of the various turbulence components.

$$\Sigma(\hat{m}_i) \approx \sigma_i \sqrt{2 \left( \frac{\tau_i}{T} - \frac{\tau_i^2}{T^2} \right)} \quad i = u, p \quad (62)$$

$$\Sigma(\hat{m}_i) \approx \sigma_i \sqrt{\frac{\tau_i}{T}} \quad i = v, w \quad (63)$$

$$\Sigma(\hat{m}_i) \approx \frac{\sigma_j}{V\tau_i T} \left\{ \begin{aligned} & T\tau_j(R_{j-} + R_{j+}) + T\tau_i(R_{i-} + R_{i+}) + T\tau_j^2(R_{j+\tau} - R_{j-\tau}) \\ & - \tau_j^2(R_{j+} + R_{j-}) - \tau_i^2(R_{i+} + R_{i-}) + 2\tau_j^3(R_{j-\tau} - R_{j+\tau}) \end{aligned} \right\}^{\frac{1}{2}} \quad i, j = q, w \text{ or } r, v \quad (64)$$

Equations (65) through (68) define the theoretical standard deviation of sample standard deviations for each component.

$$\Sigma(\hat{\sigma}_i) \approx \sigma_i \left\{ \left( \frac{\tau_i}{2T} - \frac{9\tau_i^2}{4T^2} + \frac{4\tau_i^3}{T^3} - \frac{2\tau_i^4}{T^4} \right) \right\}^{\frac{1}{2}} \quad i = u, p \quad (65)$$

$$\Sigma(\hat{\sigma}_i) \approx \frac{\sigma_i}{2} \left\{ \left( \frac{13\tau_i}{4T} - \frac{83\tau_i^2}{8T^2} \right) \right\}^{\frac{1}{2}} \quad i = v, w \quad (66)$$

$$\Sigma(\hat{\sigma}_i) \approx \frac{\sigma_j^2}{\sigma_i V^2 \tau_i^2 T \sqrt{2}} \left\{ S_{00} - 2 \left[ \begin{aligned} & T\tau_j(R_{j-} + R_{j+}) + T\tau_i(R_{i-} + R_{i+}) \\ & + T\tau_j^2(R_{j+\tau} - R_{j-\tau}) - \tau_j^2(R_{j+} + R_{j-}) \\ & - \tau_i^2(R_{i+} + R_{i-}) + 2\tau_j^3(R_{j-\tau} - R_{j+\tau}) \end{aligned} \right] \right\}^{\frac{1}{2}} \quad (67)$$

where

$$\begin{aligned}
S_{00} = & \frac{T\tau_j}{2} \left( R_{j-}^2 + R_{j+}^2 \right) + \frac{T\tau_i}{2} \left( R_{i-}^2 + R_{i+}^2 \right) + \frac{2T}{\left( 1/\tau_i + 1/\tau_j \right)} \left( R_{j-}R_{i-} + R_{j+}R_{i+} \right) \\
& + \frac{\tau_j^2}{4} \left( -R_{j-}^2 - 2R_{j-}R_{j-\tau}T - R_{j+}^2 + 2R_{j+}R_{j+\tau}T \right) - \frac{\tau_i^2}{4} \left( R_{i-}^2 + R_{i+}^2 \right) \\
& + \frac{2R_{i+} \left( R_{j+\tau}T - R_{j+} \right) - 2R_{i-} \left( R_{j-\tau}T + R_{j-} \right)}{\left( 1/\tau_i + 1/\tau_j \right)^2} + \frac{4 \left( R_{j+\tau}R_{i+} + R_{j-\tau}R_{i-} \right)}{\left( 1/\tau_i + 1/\tau_j \right)^3} \\
& + \frac{\tau_j^3}{4} \left[ R_{j+\tau} \left( R_{j+\tau}T - 2R_{j+} \right) + R_{j-\tau} \left( R_{j-\tau}T + 2R_{j-} \right) \right] - \frac{3\tau_j^4}{8} \left( R_{j-\tau}^2 + R_{j+\tau}^2 \right)
\end{aligned} \tag{68}$$

In the above equations  $T$ , defined by  $T = NT_V$ , is the length of the turbulence sequence. ( $N$  is the number of samples in the sequence.) The variables  $\sigma, \tau, V, T_V$  were defined previously in the section entitled Continuous Model. The variables  $R_{i-}, R_{j-}, R_{i+}, R_{j+}, R_{j-\tau}, R_{j+\tau}$  are defined in the subsequent section discussing autocorrelation.

Code

Equations (62) through (68) were implemented in the MATLAB m-file *newA41.m*. Comments were added to the file to identify equation numbers listed in the previous section. The variables *Smhatuu*, *Smhatpp*, *Smhatqq*, *Smhatrr*, and *Smhatwv* defined in file *newA41.m* are the standard deviations of the sample means. The variables *Ssighatuu*, *Ssighatpp*, *Ssighatqq*, *Ssighatrr*, and *Ssighatwv* defined in file *newA41.m* are the standard deviations of sample standard deviations.

## Autocorrelation

The theoretical autocorrelation functions were needed to compute some of the theoretical statistics discussed previously. The functions were also used for comparison with correlation functions computed from the sample sequences produced with the GUSTMDL program.

### Equations

The autocorrelation function  $R_{ii}(\tau)$ ,  $i = u, p$ , for the u- and p-components can be found from the Fourier transform of the spectral density as follows:

$$\begin{aligned} R_{ii}(\tau) &= \mathcal{F}^{-1}\{S_{ii}(\omega)\} \\ &= \mathcal{F}^{-1}\left\{\frac{\sigma_i^2 \tau_i}{\pi} \frac{1}{1+(\tau_i \omega)^2}\right\} \quad i = u, p \\ &= \sigma_i^2 e^{-|\tau|/\tau_i} \end{aligned} \quad (69)$$

The autocorrelation function for the w-component is

$$R_{ww}(\tau) = \frac{3\sigma_w^2}{\tau_w} \left[ \frac{\tau_w}{3} e^{-|\tau|/\tau_w} - \frac{1}{6} |\tau| e^{-|\tau|/\tau_w} \right] \quad (70)$$

Since the spectra of the v-component and w-component are the same, the autocorrelation function  $R_{vv}(\tau)$  is also given by equation (70). For the q- and r-components

$$R_{ii}(\tau) = \begin{cases} \frac{\sigma_j^2}{V^2 \tau_i^2} \left[ R_{j-} e^{\tau/\tau_j} + R_{j-\tau} \tau e^{\tau/\tau_j} + R_{i-} e^{\tau/\tau_i} \right] & \text{for } \tau < 0 \\ \frac{\sigma_j^2}{V^2 \tau_i^2} \left[ R_{j+} e^{-\tau/\tau_j} + R_{j+\tau} \tau e^{-\tau/\tau_j} + R_{i+} e^{-\tau/\tau_i} \right] & \text{for } \tau \geq 0 \end{cases} \quad (71)$$

$$\text{where } R_{j-} = \begin{cases} 1 - \frac{1/\tau_i}{(1/\tau_i + 1/\tau_j)} + \frac{1/(2\tau_j \tau_i)}{(1/\tau_i + 1/\tau_j)^2} - \frac{1/\tau_i}{(1/\tau_i - 1/\tau_j)} - \frac{1/(2\tau_j \tau_i)}{(1/\tau_i - 1/\tau_j)^2} \\ + \frac{1/\tau_i^2}{(1/\tau_i^2 - 1/\tau_j^2)} - \frac{1/(2\tau_j \tau_i^2)}{(1/\tau_i + 1/\tau_j)^2 (1/\tau_i - 1/\tau_j)} + \frac{1/(2\tau_j \tau_i^2)}{(1/\tau_i - 1/\tau_j)^2 (1/\tau_i + 1/\tau_j)} \end{cases} \quad (72)$$

$$R_{j-\tau} = \frac{1}{2\tau_j} - \frac{1/(2\tau_j \tau_i)}{(1/\tau_i + 1/\tau_j)} - \frac{1/(2\tau_j \tau_i)}{(1/\tau_i - 1/\tau_j)} + \frac{1/2\tau_j \tau_i^2}{(1/\tau_i^2 - 1/\tau_j^2)} \quad (73)$$

$$R_{i-} = \frac{1/(2\tau_i)}{(1/\tau_i - 1/\tau_j)} - \frac{1/(2\tau_i)}{(1/\tau_i + 1/\tau_j)} + \frac{1/(4\tau_j \tau_i)}{(1/\tau_i - 1/\tau_j)^2} + \frac{1/(4\tau_j \tau_i)}{(1/\tau_i + 1/\tau_j)^2} \quad (74)$$

$$R_{j+} = \begin{cases} 1 - \frac{1/\tau_i}{(1/\tau_i - 1/\tau_j)} - \frac{1/(2\tau_j\tau_i)}{(1/\tau_i - 1/\tau_j)^2} - \frac{1/\tau_i}{(1/\tau_i + 1/\tau_j)} + \frac{1/(2\tau_j\tau_i)}{(1/\tau_i + 1/\tau_j)^2} \\ + \frac{1/\tau_i^2}{(1/\tau_i^2 - 1/\tau_j^2)} + \frac{1/(2\tau_j\tau_i^2)}{(1/\tau_i - 1/\tau_j)^2(1/\tau_i + 1/\tau_j)} - \frac{1/(2\tau_j\tau_i^2)}{(1/\tau_i + 1/\tau_j)^2(1/\tau_i - 1/\tau_j)} \end{cases} \quad (75)$$

$$R_{j+\tau} = -\frac{1}{2\tau_j} + \frac{1/(2\tau_j\tau_i)}{\left(1/\tau_i - 1/\tau_j\right)} + \frac{1/(2\tau_j\tau_i)}{\left(1/\tau_i + 1/\tau_j\right)} - \frac{1/2\tau_j\tau_i^2}{\left(1/\tau_i^2 - 1/\tau_j^2\right)} \quad (76)$$

$$R_{i+} = -\frac{1/(2\tau_i)}{\left(1/\tau_i + 1/\tau_j\right)} + \frac{1/(2\tau_i)}{\left(1/\tau_i - 1/\tau_j\right)} + \frac{1/(4\tau_j\tau_i)}{\left(1/\tau_i + 1/\tau_j\right)^2} + \frac{1/(4\tau_j\tau_i)}{\left(1/\tau_i - 1/\tau_j\right)^2} \quad (77)$$

These equations were coded in the MATLAB m-file *newA41.m* presented in the previous section. Comments were added to the code to refer to equation numbers listed in this section. The variables  $Ruu$ ,  $Rpp$ ,  $Rqq$ ,  $Rrr$ , and  $Rwv$  are the autocorrelation functions from equations (69) through (71) for the turbulence components. The variables  $Rjneg$ ,  $Rjnegt$ ,  $Rineg$ ,  $Rjpos$ ,  $Rjpost$ , and  $Ripos$  in file *newA41.m* are the constants defined in equations (72) through (77).

Code

Code in MATLAB file *A41plt.m* was generated to plot the theoretical autocorrelation functions discussed above that are calculated in file *newA41.m*. The MATLAB files *newA41.m* and *A41plt.m* should be executed sequentially to be able to plot theoretical autocorrelation functions. The file *A41plt.m* also computes and plots the sample autocorrelation functions of the turbulence sequences produced by the GUSTMDL program. These autocorrelation functions were computed using the MATLAB function *xcorr* from the Signal Processing Toolbox. The code for *A41plt.m* follows.

### Plots

Example plots of autocorrelation functions produced by *A4Iplts.m* for  $V = 100$  ft/sec and  $V = 1000$  ft/sec are found in this section. The sample autocorrelation functions are for 819-sec turbulence sequences produced using GUSTMDL.

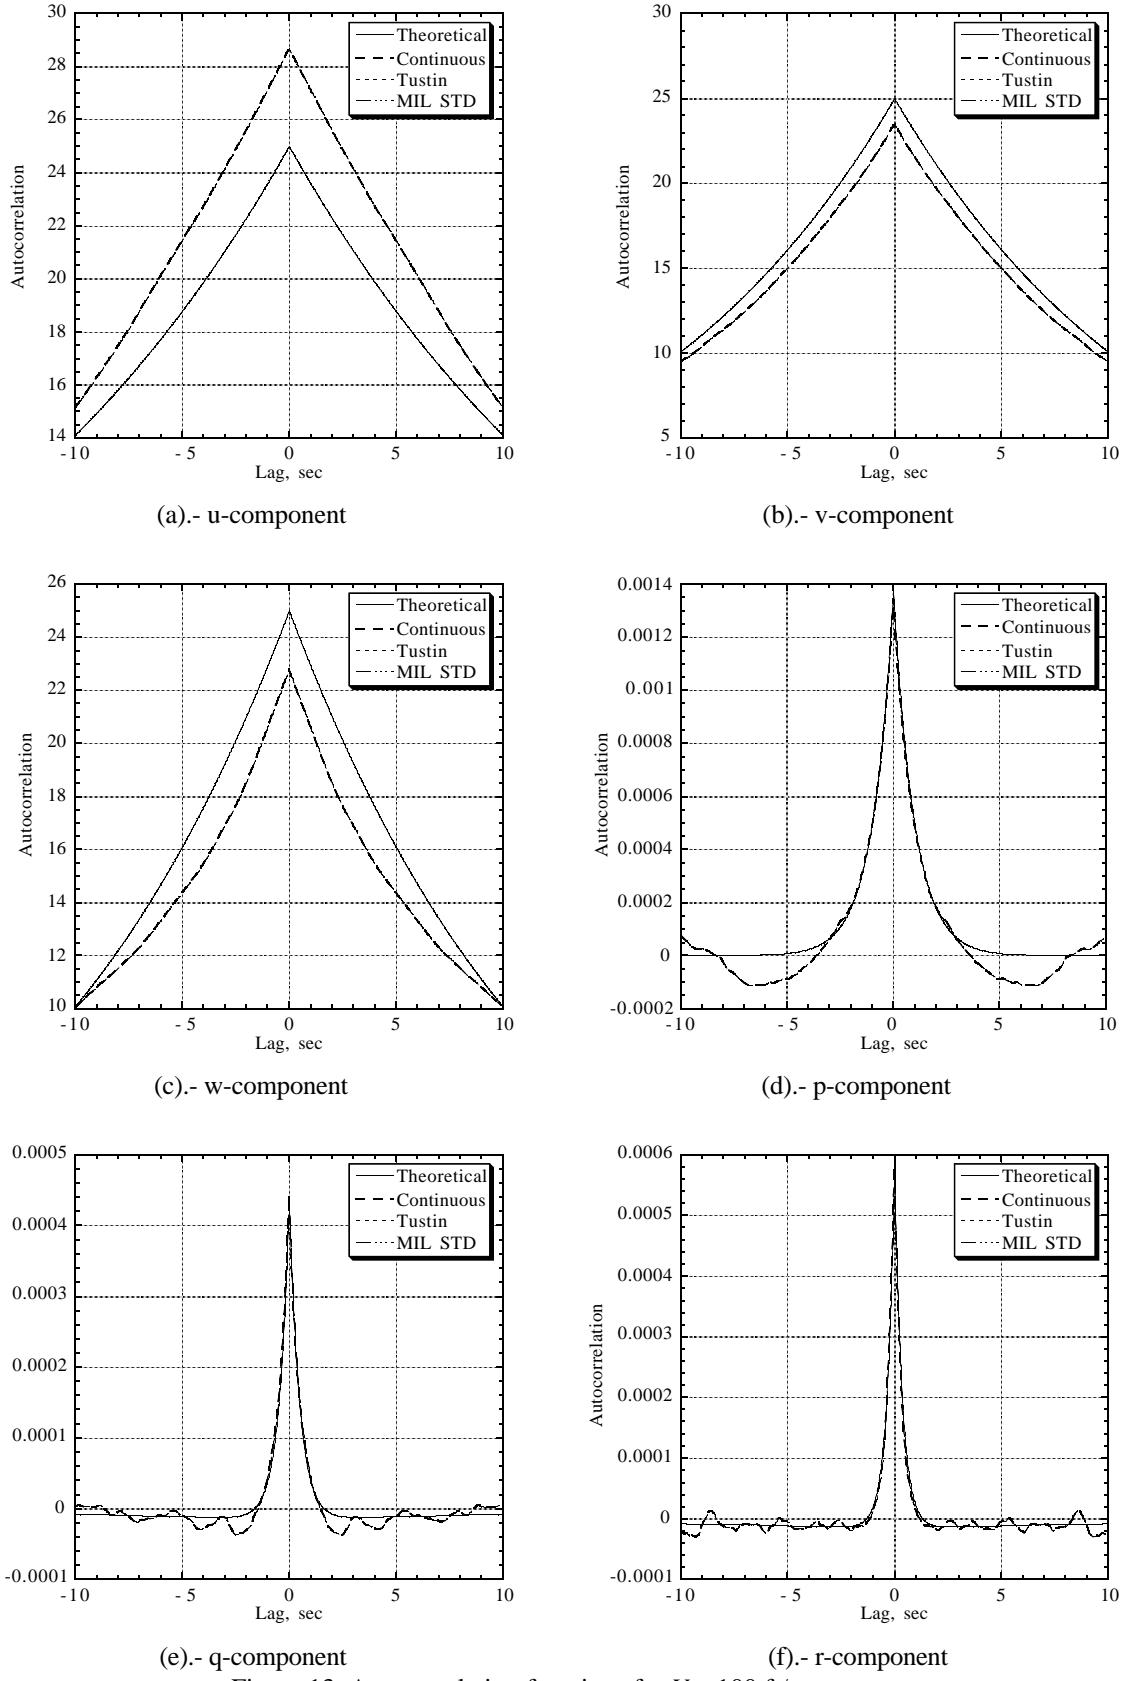

Figure 13. Autocorrelation functions for  $V = 100$  ft/sec.

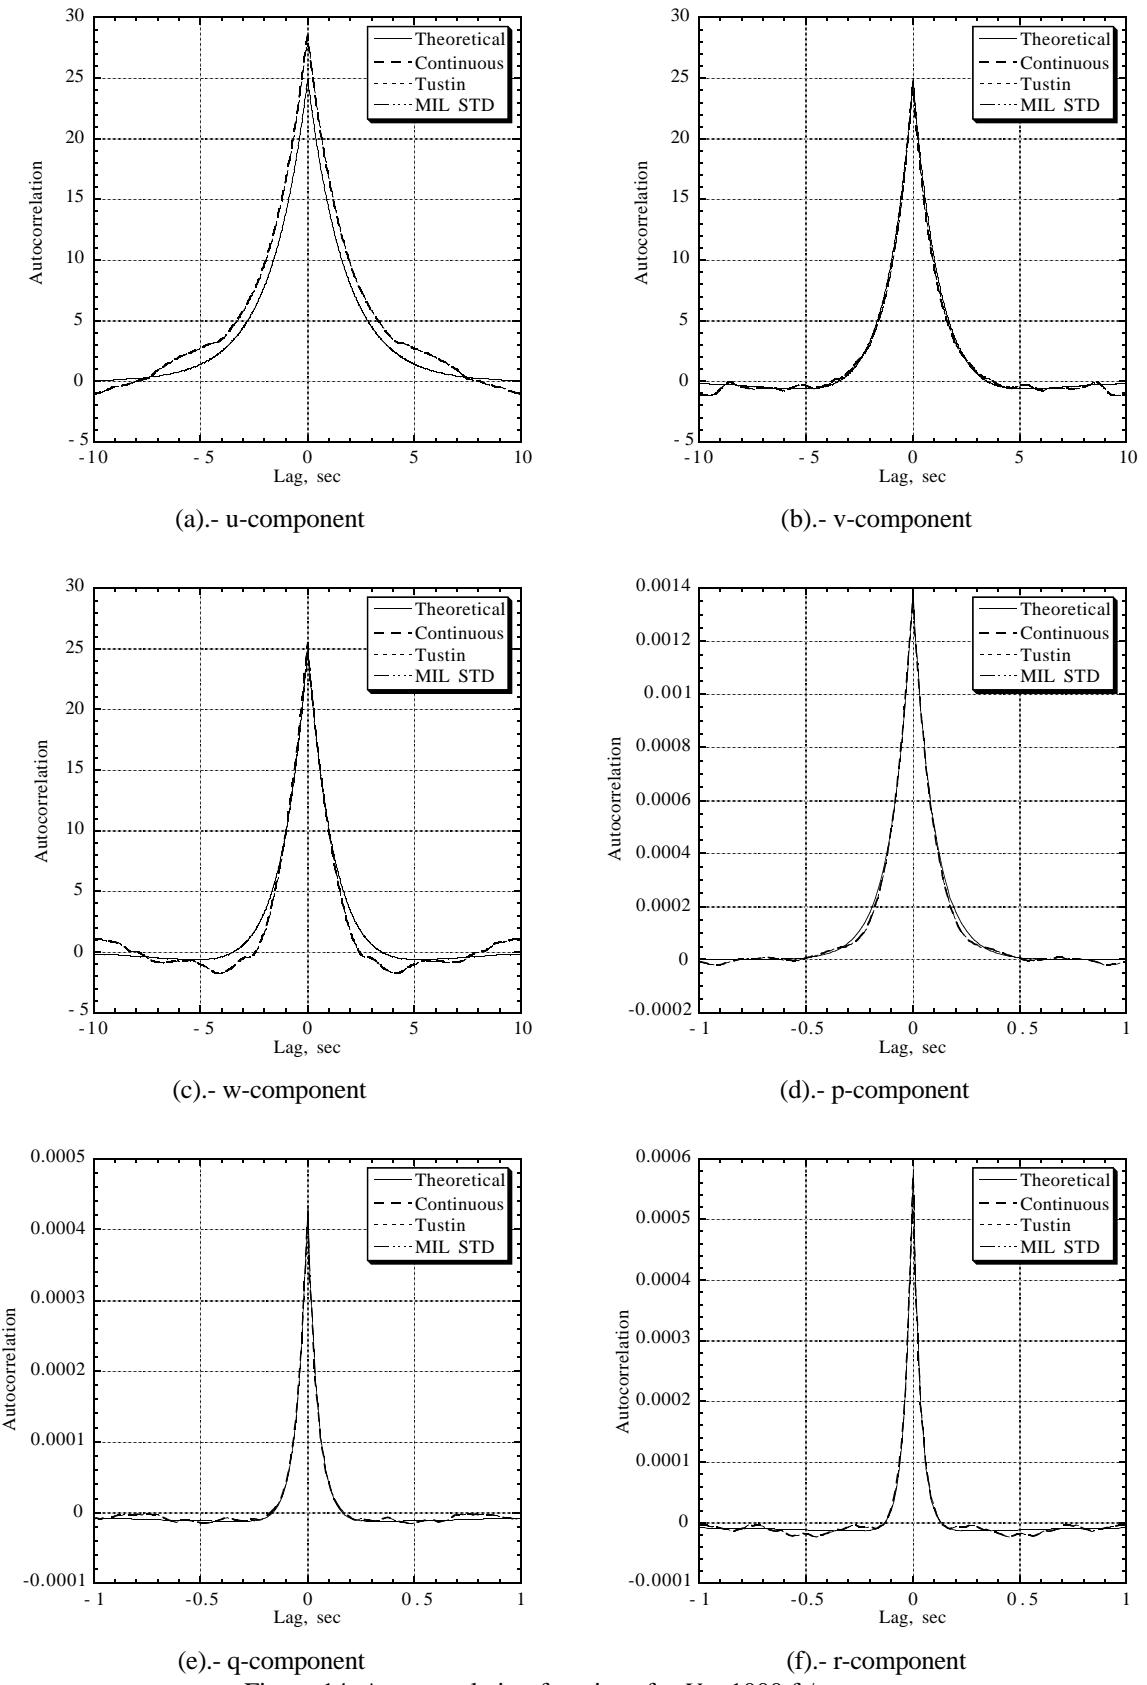

Figure 14. Autocorrelation functions for  $V = 1000$  ft/sec.

## Aircraft Simulation

The turbulence models and implementations discussed in previous sections of this report were developed for use in aircraft simulations, primarily nonlinear six-degree-of-freedom simulations. The models were installed in a nonlinear six-degree-of-freedom simulation of the High Alpha Research Vehicle (refs. 3 and 4) for evaluation and comparison among the three models. The HARV simulation is written in ACSL with FORTRAN subroutines to implement input/output, sensor models, and control laws. The equations of motion are integrated in the ACSL DERIVATIVE BLOCK (ref. 5).

### Code

Much of the code installed in the HARV simulation to implement the turbulence models was taken without change from the GUSTMDL program. In GUSTMDL the coefficients in the differential and difference equations were computed one time in the INITIAL BLOCK, since aircraft airspeed  $VTOT$  was kept constant. In the HARV simulation some of these coefficients must be computed in the DERIVATIVE or DISCRETE BLOCKS to accommodate changes in airplane airspeed during the simulated flight.

In this section the entire HARV simulation code will not be presented for to do so would significantly increase the length of the report while adding very little information relative to the turbulence models and their implementation. Instead, portions of code which show all of the modifications made to the simulation to install the turbulence models will be included. In the code presentation below, to avoid confusion sections of simulation code are separated from portions of report text by a line of #'s.

In the MACRO SECTION MACRO DRMS was inserted after the existing MACRO ALFDYN. The code for MACRO DRMS follows and was used to compute statistics needed for evaluation of the performance of the three turbulence models.

```
# # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # #  
!  
!*****  
MACRO DRMS(RMSX, MNX , X, N )  
!*****  
!  
!      MACRO TO COMPUTE SAMPLE STATISTICS OF RANDOM VARIABLE  
!          WTB, JCY 2-24-94  
!  
MACRO REDEFINE SUM, SUMSQ, EPS  
    CONSTANT SUM = 0., SUMSQ = 0.  
    CONSTANT EPS = 1.E-22  
    SUM = SUM + X  
    SUMSQ = SUMSQ + X*X  
    MNX = SUM/N  
    RMSX = SQRT(MAX((SUMSQ - MNX*SUM) / (MAX(N-1.,EPS)),0.))  
MACRO EXIT  
MACRO END  
!  
# # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # #
```

In the INITIAL BLOCK constants were initialized. The code showing initial values needed by the implementation of the three turbulence models follows. Comments indicating equation numbers refer to the previously defined equations in this report.

```
# # # # # # # # # # # # # # # # # # # # # # # # # # # # # # # #  
    RA2DG = 180./ACOS(-1.)  
    DG2RA = 1./RA2DG
```

```
# # # # # # # # # # # # # # # # # # # # # # # # # # # # # # #
```

Variables implementing the continuous models were placed in the DERIVATIVE BLOCK of the ACSL simulation. They were inserted with the steady-state wind model after the END statement for the linearization procedural and before the table look-ups for the HARV aerodynamic model. This placement of the model allows the latest turbulence velocities to be included in the calculation of aerodynamic forces and moments.

### Time History Plots

Numerous runs were made with the modified HARV aircraft simulation to evaluate the performance of the implemented turbulence models. The 20-second runs were made with five trim cases. Some runs set the *PQRFLG* variable to .True. to use effects of p, q, and r gust effects, while other runs had a value of .False. for the *PQRFLG* variable. All runs used the same random seed for noise generation. Time history plots of comparisons of the continuous, Tustin, and MIL STD models for each trim case are presented below in figures 15 through 59. Attitude and air data variables are also plotted. The five trim cases plotted were for  $\alpha$  values of  $5^\circ$ ,  $25^\circ$ ,  $35^\circ$ ,  $55^\circ$ , and  $60^\circ$ . Figures 15 through 23 are the time histories for the  $\alpha = 5^\circ$  trim case. Figures 24 through 32 are the time histories for the  $\alpha = 25^\circ$  trim case. Figures 33 through 41 are the time histories for the  $\alpha = 35^\circ$  trim case. Figures 42 through 50 are the time histories for the  $\alpha = 55^\circ$  trim case. Figures 51 through 59 are the time histories for the  $\alpha = 60^\circ$  trim case.

| 13. ABSTRACT (Maximum 200 words)<br>This report presents three methods of implementing the Dryden power spectral density model for atmospheric turbulence. Included are the equations which define the three methods and computer source code written in Advanced Continuous Simulation Language to implement the equations. Time-history plots and sample statistics of simulated turbulence results from executing the code in a test program are also presented. Power spectral densities were computed for sample sequences of turbulence and are plotted for comparison with the Dryden spectra. The three model implementations were installed in a nonlinear six-degree-of-freedom simulation of the High Alpha Research Vehicle airplane. Aircraft simulation responses to turbulence generated with the three implementations are presented as plots. |  |   |  |
